Vision Components

This section covers all the built-in Vision components. While the component is selected, you can use the Property Editor panel to alter the component's properties, which changes the component's appearance and behavior. Shapes are Vision components too. Each shape may be individually selected, named, and has its own properties. Shapes have some additional capabilities that other Vision components don't have, such as the ability to be rotated. Shapes are created using the shape tools, not dragged from the component palette.

To make any of these components do something useful, like display dynamic information or control a device register, you configure property bindings f or the component. To make the component react to user interaction, you configure event handlers for it.

Input Components

The following components allow users to enter or select data.

In This Section ...

Vision - Text Field

Component Palette Icon:

On this page ... • Properties • Scripting • Event Handlers • Customizers • Examples

The Text Field component is used for input of any single-line text. This component will accept any alpha-numeric input. If you're looking for a numeric field, see the Vision - Numeric Text Field.

This field features a protected mode. When you enable the protectedMode property, the field is not editable even when it receives input focus. The user must double click on the field or press enter in order to edit the field. When they are done (press enter again or leave the field), the field becomes non-editable again.

The Text Field also supports the reject updates during edit feature. This feature ignores updates coming from property bindings while the component is being edited by a user.

Name	Description	Property Type	Scripting	Categor
Backgro und	The background color of the text box (when editable).	Color	editableBac kground	Appearan
Border	The border surrounding this component. Options are No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Commit On Focus Loss	If true, any pending edit will take effect when focus is lost. If false, the user must press ENTER for an edit to take effect.	boolean	commitOnF ocusLost	Behavior
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Defer Updates	When true, the 'text' property will not fire updates while typing, it will wait for Enter to be pressed.	boolean	deferUpdates	Behavior
Editable?	If true, this is an input box, if false, this is display-only.	boolean	.editable	Behavior
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component.	Color	.foreground	Appearan

Component Palette Icon:

12 Numeric Text Field

The Numeric Text Field is similar to the standard Text Field, except that it is specialized for use with numbers. Instead of a Text property, it has four numeric "value" properties: integer, double, long, and float. Which one you use depends on the mode of the text box.

Like the standard Text Field, this text field can operate in protected mode. When you enable the protected property, the field is not editable even when it receives input focus. The user must double click on the field or press enter in order to edit the field. When they are done (press enter again or leave the field), the field becomes non-editable again.

The Numeric Text Field also supports the reject updates during edit feature. This feature ignores updates coming from property bindings while the component is being edited by a user.

Name	Description	Property Type	Scripting	Categor
Backgro und	The background color of the text box (when editable).	Color	editableBac kground	Appearan
Border	The border surrounding this component. No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Commit On Focus Loss	If true, any pending edit will take effect when focus is lost. If false, the user must press Enter for an edit to take effect.	boolean	commitOnF ocusLost	Behavior
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Decimal Format	The formatting string used for displaying numbers.	String	decimalFor mat	Appearan
Defer Updates	When true, the value properties will not fire updates while typing, it will wait for Enter to be pressed.	boolean	deferUpdates	Behavior
Editable?	If true, this is an input box, if false, this is display-only.	boolean	.editable	Behavior
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common
Error on Out-of- Bounds	Show an error message if the user input is out-of-bounds?	boolean	errorOnOut OfBounds	Behavior
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component.	Color	.foreground	Appearan

Horizont al Alignme nt	Determines the alignment of the label's contents along the X axis.	int	horizontalAli gnment	Layout
Maximum	The maximum value (inclusive), if useBounds is true.	double	.maximum	Data
Minimum	The minimum value (inclusive), if useBounds is true.	double	.minimum	Data
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Non- Editable Backgro und	The background color to use when this text box is non-editable	Color	nonEditable Background	Appearan
Number Type	What type of numbers should this field accept?	int	.mode	Data
Out Of Bounds Message	The error message to display if input is out-of-bounds.	String	outOfBound sMessage	Behavior
Protecte d Mode?	If true, users will need to double-click in the field in order to edit the value.	boolean	protectedMo de	Behavior
Quality	The data quality code for any Tag bindings on this component.		.quality	Data
Reject Updates During Edit	If true, this field will not accept updates from external sources (like DB bindings) while the user is editing the field.	boolean	rejectUpdat esDuringEdit	Behavior
Styles	Contains the component's styles.	Dataset	.styles	Appearan
Suffix	A string to display after the value.	String	.suffix	Appearan
Touchsc reen Mode	Controls when this input component responds if touchscreen mode is enabled.	int	touchscreen Mode	Behavior
Use Bounds?	Only allows user-entered values between a minimum and maximum. Unless you turn on "Error on out-of-bounds", user-entered values will be silently modified to be in-bounds.	boolean	.useBounds	Behavior
Value (Double)	The value as a double. Make sure you use the value property that corresponds to your Number Type setting.	double	doubleValue	Data
Value (Float)	The value as a float. Make sure you use the value property that corresponds to your Number Type setting.	float	.floatValue	Data
Value (Integer)	The value as an integer. Make sure you use the value property that corresponds to your Number Type setting.	int	.intValue	Data
Value (Long)	The value as a long. Make sure you use the value property that corresponds to your Number Type setting.	long	.longValue	Data
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

See the Vision - Numeric Text Field Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

Vision - Spinner

Component Palette Icon:

On this page ... • Properties • Scripting • Component Functions • Extension Functions • Event Handlers • Customizers • Examples

The spinner component represents a value that is part of a series of values, such as numbers and dates. It allows you to not only edit the value directly, but to 'spin' the value up or down, using the up and down buttons that are part of the component. When setting up property bindings, make sure you use the value property that corresponds to the spinner mode. For example, if you chose the Double spinner mode, you should bind the doubleValue property.

Name	Description	Property Type	Scripting	Categor
Backgro und Color	The background color of the component.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Date Format	A date format pattern to use when the spinner is in date mode.	String	.dateFormat	Appearan
Date in Milliseco nds	The date in milliseconds from epoch time. (Read only. Usable in bindings and scripting.)	long	.dateInMillis	Uncategor ed
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.foreground	Appearan
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Number Format	A number format pattern to use when the spinner is in numeric mode.	String	numberFor mat	Appearan
Numeric Maximum	The maximum value this spinner will accept when in 'Integer' or 'Double' mode.	double	.maxValue	Data
Numeric Minimum	The minimum value this spinner will accept when in 'Integer' or 'Double' mode.	double	.minValue	Data
Numeric Step Size	The size to step up or down when in 'Integer' or 'Double' mode.	double	.stepSize	Behavior

Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Spinner Mode	The mode controls which data type this spinner accepts.	int	spinnerMode	Behavior
Styles	Contains the component's styles.	Dataset	.styles	Appearan
Touchsc reen Mode Controls when this input component responds if touchscreen mode is enabled. int .				
Value (Date)	The current value if mode is 'Date'.	Date	.dateValue	Data
Value (Double)	The current value if mode is 'Double'.	double	doubleValue	Data
Value (Integer)	The current value if mode is 'Integer'.	int	.intValue	Data
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

🖾 Formatted Text Field

On this page ... • Properties • Scripting • Component Functions • Extension Functions • Event Handlers • Customizers • Examples

This specialized text field is used for alphanumeric text input that must match some specific pattern or needs to be formatted in a specific way. It operates in two modes:

Formatted Mask

In this mode, input is automatically formatted and restricted based on a format mask. For example, a format mask like: (###) ###-#### will allow the entry of a 10-digit US phone number. The formatting characters are automatically inserted if the user does not type them in. Any other characters are restricted. The following characters may be used in a formatted mask pattern:

Symbol	Description
#	Any valid number, Such as 0-9.
1	Escape character, used to escape any of the special formatting characters.
U	Any letter. All lowercase letters will be mapped to upper case automatically.
L	Any letter. All upper case letters will be mapped to lower case automatically.
А	Any letter or number.
?	Any letter, case is preserved.
*	Anything.
н	Any hex character (0-9, a-f or A-F).

Regular Expression

In this mode, input is validated against a regular expression. A regular expression is a special string that defines a set of allowed strings. Any input that matches the given regular expression is allowed, and input that doesn't match, is restricted. And yes, while powerful, regular expressions are decidedly difficult to decipher.

Name	Description	Property Type	Scripting	Categor
Allows Invalid Text	Allows Invalid text to Commit.	boolean	allowsInvalid	Behavior
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector .	Color	.background	Appearan

Border	The border surrounding this component. Options are No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), and Field Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Commit While Typing	Commits valid text while user is typing.	boolean	commitsOn ValidEdit	Behavior
Committ ed Value	Committed text value.	String	committedV alue	Data
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common
Focus Lost Behavior	Controls how a transaction can be committed.	int	focusLostBe havior	Behavior
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector .	Color	.foreground	Appearan
Formatte d Mask Pattern	Formatted Mask Validation Pattern.	String	formattedMa skPattern	Behavior
Horizont al Alignme nt	Determines the alignment of the label's contents along the X axis.	int	horizontalAli gnment	Layout
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data

Property Name	Value
Line Wrap	True
Text	468 Characters
Rows	0
Columns	0

Vision - Dropdown List

<Select One>

Component Palette Icon:

Dropdown List

On this page ... • Properties • Scripting • Component Functions • Extension Functions • Event Handlers • Customizers • Examples

The Dropdown component displays a list of choices in a limited amount of space. The list of choices is stored in a dataset, which can be manually typed in the Designer or populated dynamically from a property binding, often a SQL Query binding.

You may want to display choices to the user that are mapped to a different value internally, such as a numeric code. The columns in your dataset will determine which strings are visible to the end user (Selected Label) and which integers or strings are stored as the component's Selected Value or S elected String Value. There are three ways to configure a dropdown dataset:

Scenario 1: One column dataset with a set of string values

Column1
Apples
Oranges
Bananas

- Dropdown displays values from the first column
- Selected Value is undefined
- Selected String Value represents value from first column
- Selected Label represents value from first column

Scenario 2: Two column dataset with an integer and a string column

Column1	Column2
201	Apples
202	Oranges
203	Bananas

- Dropdown displays values from the second column
- Selected Value represents a value from the first column
- Selected String Value represents value from second column
- Selected Label represents value from second column

Scenario 3: Two column dataset with two string columns

Column1	Column2
APL	Apples
ORN	Oranges
BAN	Bananas

• Dropdown displays values from the second column

- Selected Value is undefined
- Selected String Value represents value from first column
- Selected Label represents value from second column

The dropdown component can operate in one of three Selection Modes. These modes affect how the dropdown's current selection (defined by the values of its Selected Value, Selected String Value, and Selected Label properties) behave when the selection properties are set to values not present in the choice list, or conversely, when the choice list is set to a new dataset that doesn't contain the current selection:

• Strict. Selected values must always correlate to an option in the list defined by the Data property. If an invalid selection is set (via a binding or a script), the selection will be set to the value defined by the No Selection property. If the Data property is set to a list that does not contain the current selection, the current selection will be reset to the No Selection value.

• Lenient. (default) Selected values are independent of the list defined by the Data property. This mode is useful to avoid race conditions that can cause problems in Strict mode when both the Data and the Selected Value properties are bound. If the current selection is not present in the Data list, the read-only property Selected Index will be -1.

• Editable. The same selection rules as defined by Lenient mode, except that the dropdown itself becomes editable, allowing a user to type in their own value. This value will be set as the dropdown's Selected Label.

Name	Description	Property Type	Scripting	Categor
Backgro und Color	The background color of the component.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common

Customizers

- The Multi-State Button Customizer consists of four panels:
 - **Preview**: Displays a preview image of the component
 - States: Displays a list of possible states. Each state corresponds to one button. You may add, remove, and re-order states.
 - Selected Style: Displays configurable style properties for the selected button. The button will use this style when its state is active.
 Unselected Style: Displays configurable style properties for the selected button. The button will use this style when its state is inactive.

Vision - One-Shot Button

One-Shot Button

Component Palette Icon:

One-Shot Button

On this page ... • Properties • Scripting • Component Functions • Extension Functions • Event Handlers • Customizers • Examples

The One-Shot button is great for telling a PLC to do something. It simply writes a value, and then waits for it to be reset by the PLC before it is available again. This is only applicable when the PLC is programmed to reset the value after reading it. If your PLC expects the HMI to reset the bit, use the Momentary Button.

Note: This component is considered safer than the momentary button, because it receives positive feedback from the PLC that the signal was received, avoiding the timing dangers associated with a Momentary Button.

To use the One-Shot button, bind an OPC tag bidirectionally to the button's Value property. When clicked, the button will write the value in its Set Value property to the Value property. Typically, Set Value is 1, and Value is 0 in a ready state, although the logic could be reversed or change simply by altering Set Value. The button can disable itself when it is writing, and will display different text. The button considers itself to be writing whenever Value equals Set Value - you must make sure that the PLC resets this value, otherwise the button will remain in a writing state.

Vision - Momentary Button

Momentary Button

Component Palette Icon:

Momentary Button

Momentary buttons are used to set a value for either a fixed amount of time, or however long the button remains held down, whichever is longer. Once the button is released, or the minimum time expires, the value is reset.

The momentary button uses its Control Value property to affect the underlying data. Typically, this property uses a bidirectional tag binding to an OPC tag. When pressed, it will write its On Value to the Control Value property. When released, it will either write Off Value to the Control Value immediately , or wait until On Time has elapsed (since the pressed event).

The button's Indicator Value, which is typically bound to the same OPC tag as Control Value, is used to draw an "active" indication border around the button. This gives the operator positive feedback that the value has written successfully. It also lets an operator at one terminal know if an operator at a different terminal is using the button currently.

If the client is closed before the **Min Hold Time** period on the Momentary Button expires, then it is possible for the button to remain in the **ON** or latched state. Thus, if the **Control Value** property of the component is bound to a tag, the tag will remain in the **ON** state after the client is closed. Some logic or functionality will need to be applied to reset the tag in this scenario: typically the PLC is relied on in these scenarios to reset the value

Alternatively, you may wish to use a Vision - One-Shot Button instead, as that component was designed for use in situations where the PLC will reset the value.

The Toggle button represents a bit: on (selected) or off (not selected). Visually the button looks down or depressed when it is selected, and up when it is not selected. Logically, this component is very similar to the Check Box component.

Note: For implementing a controls screen, the 2 State Toggle is usually more appropriate than this component.

Vision - Radio Button

Radio Button

Component Palette Icon:

e- Radio Button

On this page ... • Properties • Scripting • Component Functions • Extension Functions • Event Handlers • Customizers • Examples

The radio button is similar to the CheckBox component, except for one special property. All radio buttons in the same Container (including the Root Container) will automatically be mutually exclusive. This means that only one radio button can be selected at a time. Radio buttons are a good way to let the user choose just one of a number of options. Dropdown Lists are another good way to do this.

Vision - Tab Strip

On this page					
 Properties Scripting Component Functions Extension Functions Event Handlers Customizers Examples 					

In general, a Tab Strip is just a single-selection multiple choice component. In practice it is used anywhere that a user needs to be able to select between multiple windows or to select between containers to display. It is most commonly used in a docked window to provide automatic window navigation. To support this typical use-case, the tab strip has two navigation modes:

- 1. Swap to Window (default) The Tab Strip will automatically call system.nav.swapTo() with the name of the selected tab. This facilitates very easy navigation for most common projects.
- 2. **Disabled** The Tab Strip doesn't do anything when the tab selection changes. Users can implement their own via property bindings or by responding to the propertyChange scripting event.

The Tab Strips visual style is highly customizable. There are different rendering styles, and things such as fonts, colors, line thicknesses, hover colors, and gradients are customizable within each rendering style. Use the Tab Strip's customizer to come up with a style that suits your project, as well as to manage the tabs that are present. The tabs and their styles are all stored in a dataset property (called Tab Data), so they can be modified at runtime as well.

Customizers

The Tab Strip Customizer has its own set of properties that you can set and modify which dictate how the Tab Strip component looks and behaves whether or not it is used for window navigation. The tabs and the styles are stored in the **Tab Data** dataset property.

When customizing the Tab Strip, keep in mind how you are using the component when setting your properties. Some Tab Strip properties may behave a little differently based on style, tab orientation, or text alignment. It's a good idea to use the preview window to verify the style you configured is the style you want.

Tab Strip Customizer - Property Descriptions

Properties	Description
Orientation	Orientation of the Tab Strip on a window: Top , Left , Bottom and Right . For example, use the Top orientation to place the Tab Strip component at the top of your window.
Navigation Mode	 Two Navigation modes: Swap Windows - the Tab Strip automatically calls system.nav.swapTo() to perform a window swap from the current window to another window when a tab is pressed. Swap Windows is the default mode. Disabled - the Tab Strip only sets the Selected Tab property when pressed. You can set the component's behavior using property bindings or by responding to the propertyChange scripting event.
Size Mode	Two Size modes: Individual - all the tabs are the same size. Automatic - all the tabs are sized to fit the text.
Style	Three style options to change the appearance of the individual tabs: Simple, Fancy, and Folder.
Add Tab	Adds a new tab next to the selected tab.
Remove Tab	Removes a selected tab.
Move Up / Move Down	Depends on the current Orientation selection. Moves the selected tab Up or Down in the tab strip when using the Left or Right orie ntation .
Move Left / Move Right	Depends on the current Orientation selection. Moves the selected tab either Left or Right in the tab strip when using the Top / Bottom orientation.
Text Alignment	Inserts text in the Center, Left, or Right inside a tab.
Text Offset	Specifies how many pixels to move text to the left or right within a tab.
Text Padding	Specifies the number of pixels around the text in the tab.

Intertab Space	Specifies the number of pixels between tabs.	
Rounding Radius	Specifies the number of pixels to round the corners of the tab depending on the tab orientation.	
General		
Window Name	Pathname of the window location	
Display name	The name to display on the tab.

Vision - Image

Component Palette Icon:

🧧 Image

The Image component is used to display images. While other components (such as the Label) are capable of displaying images, the Image component has four additional features:

- 1. Scaling
- 2. Rotation Rotate to create spinning animations by binding to a timer component.
- Color Tinting Dynamically apply a color tint to an image to allow it to display real-time status
 Color Swapping Color swapping to change one specific color in an image to another in real time.

To choose an image, press the Browse 🛱 icon next to this component's Image Path property. You can drag new images (*.png, *.gif, *.jpg) into the Image Management window to upload them.

Images are stored on the Gateway, not in your window or project. This means that you can alter an image globally, and it will affect all windows in all projects. It also means that you must migrate custom images when performing project backups (as opposed to Gateway backups, which will automatically include both projects and images).

External Images

The Image component can also be used to display external images stored relative to the local file system on the client. The file path resembles viewing a local document in your browser:

```
file:///C:/folder/anotherFolder/image.PNG
```

Name	Description	Property Type	Scripting	Categor
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Color Swap Filter	Swap a specific color to another. Can be chosen from color wheel, chosen from color palette, or entered as RGB o r HSL value. See Color Selector .	boolean	useColorSw ap	lmage Manipulati
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common

Setting value through Scripting

You can set the component's value through scripting event.source.parent.getComponent('Level Indicator').value = 5.4

Alternatively, you can use the .setValue method to set the component's value event.source.parent.getComponent('Level Indicator').setValue(5.4)

Vision - Linear Scale

On this page	
 Properties Scripting Component Functions Extension Functions Event Handlers Customizers Examples 	

Component Palette Icon:

Elinear Scale

The Linear Scale component displays a series of tick marks and labels representing a linear range, as well as indicators that represent a value or range of values positioned on the linear scale.

There is no tall/wide property for this component. This is based on the width/height of the component. A tall Linear Scale has tick marks on the left or right, and a wide component has tick marks on the top or bottom.

Name	Description	Property Type	Scripting	Categor
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

• The Linear Scale Customizer allows you to configure the indicators that visually represent how your data is displayed on the scale. You can choose from several indicator styles: Arrow, Line, Range, and Wedge. Not all Linear Scale Customizer properties are available with all indicator styles. The property will be grayed out if it is not available for the selected indicator. Use the preview window to validate the style you want to use for your data.

To make your indicator values dynamic, use a Cell Update binding on the Indicators property of this component.

🎸 Linear Scale Customizer		×

Linear Scale Customizer - Property Descriptions

Property	Description
Indicator Style	 There are four indicator styles to choose from: Arrow, Line, Range, and Wedge. Arrow: A line with an arrow head at the given value Line: A basic flat line at the given value Range: a rectangle displayed with the given value at the bottom and a height equal to the Extent Wedge: a wedge shape centered on the given value and a height equal to the Extent
Value	The position of the indicator.
Extent	Overall thickness of the indicator. Not valid for a Line style.
Length	The number of pixels to draw the indicator starting at the component edge.
Width	Thickness of the line in the indicator. Only valid for Arrow and Line styles.
Label	Name displayed next to the indicator.
Label Angle	The angle of the label specified in degrees.
Color	Color of the indicator.
Label Color	Color of the indicator Label.

This page details the various component and extension functions available for Vision's Compass component.

Component Functions

This component does not have component functions associated with it.

Extension Functions

.configureChart(self, chart)

Description

Provides an opportunity to perform further configuration via scripting.

Parameters

Component self- A reference to the component that is invoking this function.

JFreeChart chart- A JFreeChart object. Refer to the JFreeChart documentation for <u>A</u> \underline{PI} details.

Return

None

This component displays a temperature value depicted as a level in a mercury thermometer. Three temperature intervals can optionally be defined with their own colors. The mercury will change color based on these intervals.

Name	Description	Property Type	Scripting	Categor
Axis Label Color	The color of the meter's y-axis label. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector .	Color	.axisColor	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Follow data in ranges	If true, the thermometer's Y axis will scale itself to zoom in on the current range.	boolean	followDataIn Subranges	Behavior
Interval 1 Color	The color of this interval. See Color Selector .	Color	interval1Col or	Intervals
Interval 1 High	The upper bound of this interval.	double	interval1High	Intervals
Interval 1 Low	The lower bound of this interval.	double	interval1Low	Intervals
Interval 2 Color	The color of this interval. See Color Selector .	Color	interval2Col or	Intervals
Interval 2 High	The upper bound of this interval.	double	interval2High	Intervals

Interval 2 Low	The lower bound of this interval.	double	interval2Low	Intervals
Interval 3 Color	The color of this interval. See Color Selector .	Color	interval3Col or	Intervals
Interval 3 High	The upper bound of this interval.	double	interval3High	Intervals
Interval 3 Low	The lower bound of this interval.	double	interval3Low	Intervals
Mercury Color	The default color of the mercury. See Color Selector .	Color	mercuryCol or	Appearan
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Overall High Bound	The high bound for the whole thermometer	double	.overallHigh	Data
Overall Low Bound	The lower bound for the whole thermometer	double	.overallLow	Data
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Styles	Contains the component's styles	Dataset	.styles	Appearan
Thermo meter Color	The color of the outline of the thermometer. See Color Selector .	Color	thermomete rColor	Appearan
Thermo meter Width	The width of the lines used to draw the thermometer.	int	.strokeWidth	Appearan
Units	A string to describe the units for the current value label.	int	.units	Appearan
Use Range Color	Controls whether or not the mercury color changes based on the range it is in.	boolean	useSubrang ePaint	Appearan
Value	The value to display in this thermometer. The mercury level and value label will change to reflect this.	double	.value	Data
Value Color	The color of the meter's current value label. See Color Selector .	Color	.valueColor	Appearan
Value Label Font	The font to use for the current value label.	Font	.valueFont	Appearan
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecated Properties				
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

See the Vision - Thermometer Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Component Palette Icon:

The IP camera viewing component displays a video stream from a network camera directly in one of your windows. This can be a very powerful tool for allowing operators to view remote or inaccessible locations. Cameras can provide positive feedback about the state and position of machinery, weather, and other factors.

This component is capable of displaying two types of video:

- MJPEG (a.k.a. Motion JPEG) is a streaming video protocol that compresses video frames using standard JPEG compression. Compression
 rates are quite good, requiring low network bandwidth utilization. Framerates depend greatly on the dimensions of the video, but typically
 range from 1-20 frames per second.
- JPEG stills is not a true video protocol, but is rather the practice of continually refreshing an image that a camera is constantly overwriting. Its simplicity means that many cameras support it (usually along with another protocol). Frame rates are typically lower than MJPEG because a new connection must be opened for each frame.

Most network cameras on the market support one, if not both of these protocols. Even better, if you have an existing CCTV camera system, video server devices are available that CCTV camera inputs and provide MJPEG streams the network.

Finding the URL for your network camera's video stream is usually the only challenge in connecting this component. Most, if not all, network cameras have an internal web server, allowing viewers to use web browsers to view their video stream. If you go to that webpage, and look at the HTML source of the page, you should be able to find the URL of the MJPEG or JPEG still stream.

High Resolution Streams

When viewing a feed from a High Resolution camera, the Camera Buffer Size property may need to be increased to contain all of the data from the stream.

Some examples:

Axis 2100 (MJPEG)

http://ip.address.here/axis-cgi/mjpg/video.cgi?resolution=640x480

Panasonic BL-C10A (MJPEG)

http://ip.address.here/nphMotionJpeg?Resolution=640x480&Quality=Standard

StarDot Netcam (JPEG stills)

http://ip.address.here/netcam.jpg

Vision - Tables Palette

Table Components

The following components give you various types of tables for displaying values.

In This Section ...

Vision - Table

On this page ...

Component Palette Icon:

Table

The Table component allows you to display tabular data in a variety of ways. Important features include:

- Column Sorting: Allow users to sort the data by clicking on the column headers. Sorting has three modes: Ascending, Descending, and "Natural", which uses the default order of the data.
- Mapped Row Coloring: Map the background color of each row to a particular column.
- Column Translation: Allow the table component to handle all code mapping, such as mapping 0 to "Off" and 1 to "On".
- Images: Map values to images.
- Progress Bar Indication: Display numeric data as progress bars inside cells, providing fast visual reference for bounded amounts.
- Number and Date formatting: Format numbers and dates to your specification.
- Column Hiding: Hide columns from view.
- Printing: Print tables directly to multi-paged printouts.
- Editing: Columns can be made user-editable. Changes will be reflected in the underlying dataset, at which point they can be mapped back to a database.

Changing the Column Widths

To change a table's column's widths, switch into preview mode and use your mouse to resize the columns, then switch back to design mode. To ensure that the changes to the column widths persist in the client, right-click on the table to open the table customizer and click OK without clicking anywhere else in the customizer. Clicking anywhere else in the customizer before clicking OK will reset the table column widths.

Editable Table

By setting any column to **Editable** in the Table's customizer, the user will be able to double-click in the cell and edit the data. You can the respond to the resulting **cellEdited** event with an event handler and persist the data. See the Script Builders in Vision section for more information.

Properties

Name	Description	Property Type	Scripting	Categor
Auto- Resize Mode	Determines how the table resizes the columns.	int	autoResize Mode	Behavior
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector .	Color	.background	Appearan
Backgro und Mode	This mode determines the color that this table's cell's backgrounds will be.	int	background ColorMode	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			

Column Attribute s Data	The dataset describing the column attributes.	Dataset	columnAttrib utesData	Data
Column Selectio n Allowed	This flag is used in conjunction with the Row Selection Allowed property to determine whether whole-rows, whole- columns, or both (single-cells) are selectable.	boolean	columnSele ctionAllowed	Behavior
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Data	The data for this table.	Dataset	.data	Data
Edit Click Count	The number of clicks required to start editing a cell.	int	clickCountT oStart	Behavior
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component. See Color Selector.	Color	.foreground	Appearan
Grid Line Color	The color used to draw grid lines. See Color Selector.	Color	.gridColor	Appearan
Header Font	Font of the table's header text.	Font	.headerFont	Appearan
Header Foregro und Color	The foreground color of the table's header. See Color Selector.	Color	headerFore ground	Appearan
Header Visible	Whether or not the table header is visible.	boolean	headerVisible	Appearan
Initially Selected Row	The index of the row that should be selected by default.	int	initialRowSe lection	Behavior
Mouseo ver Text	The text that is displayed in the tooltip that pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Odd Row Backgro und	The color which odd rows will be colored if background mode is 'Alternating'. See Color Selector .	Color	oddBackgro und	Appearan
Opaque	If false, backgrounds are not drawn. If true, backgrounds are drawn.	boolean	.opaque	Common
Properti es Loading	The number of properties currently being loaded. (Read only. Usable in bindings and scripting.)	int	propertiesLo ading	Uncatego ed
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Deprecate
Resizing Allowed	Whether or not the user is allowed to resize table headers or not.	boolean	resizingAllo wed	Behavior
Row Height	The height of each row, in pixels.	int	.rowHeight	Appearan
Row Selectio n Allowed	This flag is used in conjunction with the Column Selection Allowed property to determine whether whole-rows, whole-columns, or both (single-cells) are selectable.	boolean	rowSelectio nAllowed	Behavior
Selected Column	The index of the first selected column, or -1 if none.	int	selectedCol umn	Data
Selected Row	The index of the first selected row, or -1 if none.	int	selectedRow	Data
Selectio n Backgro und	The background color of a selected cell. See Color Selector .	Color	selectionBa ckground	Appearan

-				
Selectio n Foregro und	The foreground color of a selected cell. See Color Selector .	Color	selectionFor eground	Appearan
Selectio n Mode	This mode determines if only one row/cell/column can be selected at once, or single or multiple intervals.	int	selectionMo de	Behavior
Show Horizont al Grid Lines?	Shows horizontal grid lines.	boolean	showHorizo ntalLines	Appearan
Show Vertical Grid Lines?	Shows vertical grid lines.	boolean	showVertica ILines	Appearan
TestData	Toggle this property to fill in the table's data with random data.	boolean	.test	Misc
Touchsc reen Mode	Controls when this table component responds if touchscreen mode is enabled.	int	touchscreen Mode	Behavior
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

Scripting

See the Vision - Table Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

- Vision Table Customizer
- Vision Component Customizers

Examples

Binding to Selected Data

It is possible to bind other components to values in the selected row of the table. To do this, you will need to write an expression binding that protects against the case when nothing is selected or there are no rows. An expression like this would bind a label to the selected row's value in the "ProductCode" column:

Expression Binding

If you're binding to an integer, date, or other non-String value inside a dataset, you will need to cast the value to the correct type. This binding would cast the selected "Quantity" column to an integer:

Expression Binding

Adding a New Row

Code Snippet

```
#The following would add a row to the table.
#Note that this function takes a list
#And that the property types of the list are the same as the table.
name = "Motor 1"
state = 2
amps = 35
list = [name, state, amps]
table = event.source.parent.getComponent('Table')
table.addRow(list)
```

Description

The Table component is one of the most flexible and easy to configure components in Ignition. It has its own Table Customizer that allows you to make changes to tabular data and display it in a variety ways. The customizer not only lets you customize each column in the table, but together with its data properties and use of scripting and extension functions, it lets you configure how each cell in the table looks and behaves.

Customizers

The Table Customizer allows you to configure how you want the table to look to users. When you open the Table Customizer, you'll notice two tabs: Column Configuration and Background Color Mapping. The Column Configuration tab contains a number of column configuration properties that can be used to customize each column in the dataset to look a certain way. You can assign a header name, hide a column, make the column editable and sortable, align the text within the column, add a prefix by putting a "\$" in front of a value, or suffix by adding a "%" at the end of a value, select a number and date format, turn the column into a progress bar, translate a number into a string or image or even into a background or foreground color. It's even possible to change the background, foreground, and font for the text in each particular column or cell.

In the Background Color Mapping tab, you can set the table's Background property to 'Mapped', and choose a column to govern the background color of each row. The column is specified in the Mapping Column dropdown selector. The column must be a numeric type. The number to color translation works with the contents of the mapping column rows to format the cells in accordance with the selected color.

(i) TestData Property

If you want to test how the Table Customizer works in the Table, drag a Table on to your workspace, go to the Test Data property in the Property Editor, and check the 'false' checkbox. It will automatically fill the table with some test data so you get test out the Table Customizer

- Component Customizers
- Understanding Component Customizers

Table Customizer Properties

Column Configura	ation Tab
Property	Description
Header	Provide a custom name to the column header.
Hide	Hides the column.
Editable	Allows the editing of the cell pertaining to the column.
Sortable	Allows the user to sort the table according to the selected column.
Horiz Align	Aligns the contents of the column.
Vert Align	Aligns the contents of the column.
Hdr Horiz Align	Aligns the contents of the column.
Prefix	A custom text that proceeds the contents of each cell.
Suffix	A custom text that follows the contents of each cell.
Number Format	A format of the cell if the contents of the cell are number types.
Boolean	Changes the contents of the cell to reflect a 'check box' look and feel.
Progress Bar	A graphical bar is represented in the cell instead of a number.
Progress Bar Range	Sets the min and max range of the progress bar.
Hide Text Over P- Bar	Makes the value and text that controls the progress bar visible or invisible.
P-Bar Color	The color of the progress bar.
P-Bar Background	The color of the cell that has a progress bar.
Translation List Column	This works in conjunction with the Translation List. The key is provided by a named column resulting in the cells being translated according to the list that contains the key pairs.
Translation List	Defines the key/Translation pairs and translates the contents of the cell accordingly.
Image Path Column	This works in conjunction with the Image Path List. The key is provided by a named column resulting in the cells being translated according to the list that contains the key pairs.
Image Path List	Defines the key/Translation pairs and translates the contents of the cell accordingly.
Background Color Column	This works in conjunction with the Background Color List. The key is provided by a named column resulting in the cells being translated according to the list that contains the key pairs.
Background Color List	Defines the key/Translation pairs and translates the contents of the cell accordingly.
Foreground Color Column	This works in conjunction with the Foreground Color List. The key is provided by a named column resulting in the cells being translated according to the list that contains the key pairs.
Foreground Color List	Defines the key/Translation pairs and translates the contents of the cell accordingly.
Font Map Column	This works in conjunction with the Foreground Color List. The key is provided by a named column resulting in the cells being translated according to the list that contains the key pairs.
Font Map	Defines the key/Translation pairs and translates the contents of the cell accordingly. An example of a font translation could look like this "Dialog, Bold, 12"
Color Mapping Ta	ab
Mapping Column	Select a column to govern the background color of each row.
Number to Color Translation	A numeric value (typically an integer) that drives the background and foreground color of a row. For every number or value, you can choose a different color.
Fallback Color	Default color that can be set when a value does is not defined.

Example

The table in this example uses several mappings:

- Col 4 changed a number into a string: translated a priority "1" to Critical, and priority "2" to High. It also change the background colors of the cells for both priorities.
- Col 3 changed the background colors for the equipment status's "Maintenance" and "Idle" to pale red.
 Col 2 change the background color of the equipment name to pale red for the equipment status's that were "Idle" and "Maintenance."

Table

Wafer Type	Equipment	Equipment Status	Priority

Vision - Table Scripting Functions

This page details the various component and extension functions available for Vision's Table component.

Component Functions

.addRow(newRow)

Description

Adds a new row to the end of the table's dataset

Parameters

PySequence newRow - A sequence containing the values for the new row. The length of the sequence must match the number of columns in the table, and each value must be coercible into the correct datatype of the corresponding column.

Return

None

.deleteRow(rowIndex)

Description

Deletes a row from the table's dataset.

Parameters

int rowIndex - The index of the row to delete.

Return

None

.exportCSV(filename, showHeaders)

Description

Prompts the user to save the table's data as a CSV file.

Parameters

String filename - A suggested filename for the user. For example: "table_data.csv"

boolean showHeaders - If true, include headers in CSV file.

Return

String - The path to the saved file, or null if the operation was cancelled.

.getDataAsHTML(title, width)

Description

Creates an HTML page as a string in memory. This can then be written to a file, a database, emailed, etc.

Parameters

String title - The title for the HTML page.

int width - The width (in pixels) for the "table" element in the resulting html page.

Return

String - A string containing an HTML-formatted version of the table's data.

.getRowsInViewOrder()

Description

.deleteRow(rowIndex)
.exportCSV(filename, showHeaders)
.getDataAsHTML(title, width)
.getRowsInViewOrder()
.getSelectedColumn()
.getSelectedColumnCount()
.getSelectedRow()
.getSelectedRows()
.getSelectedRows()
.getSelectedRowcount()
.isCellSelected(row, column)

On this page ...

- .updateRow(rowIndex, changes)
- **Extension Functions**
- getBackgroundAt
- getForegroundAt
- getDisplayTextAt

Returns a list of ints that represent the underlying dataset's rows as they appear in the current sort order that the user is viewing.

• Parameters

None

Return

List of Integers

.getSelectedColumn()

Description

Returns the index of the currently selected column, or -1 if none is selected.

• Parameters

None

Return

int

.getSelectedColumnCount()

Description

Returns the number of columns that are currently selected.

Parameters

None

Return

int

.getSelectedRow()

Description

Returns the index of the currently selected row, or -1 if none is selected.

Parameters

None

Return

int

.getSelectedRows()

Description

Returns a list of the indexes of the selected row, or none if none is selected.

• Parameters

None

Return

List, None

.getSelectedRowCount()

Description

Returns the number of rows that are currently selected.

• Parameters

None

Return

int

.isCellSelected(row, column)

Description

Tests whether the cell at the given row and column is currently selected or not.

Parameters

int row - The row to test.

int column - The column to test.

Return

boolean

.isColumnSelected(column)

Description

Tests whether the given column is currently selected or not.

• Parameters

int column- The column to test.

Return

boolean

.isRowSelected(row)

Description

Tests whether the given row is currently selected or not.

• Parameters

int row - The row to test.

Return

boolean

.print(fitWidth, headerFormat, footerFormat, showDialog, landscape)

Description

This specialized print function will paginate the table onto multiple pages. This function accepts keyword-style invocation.

Keyword Args

boolean fitWidth - If true, the table's width will be stretched to fit across one page's width. Rows will still paginate normally. If false, the table will paginate columns onto extra pages. (default = true) [optional]

string headerFormat - A string to use as the table's page header. The substring "{0}" will be replaced with the current page number. (default = None) [optional]

string footerFormat - A string to use as the table's page footer. The substring "{0}" will be replaced with the current page number. (default = "Page {0}") [optional]

boolean showDialog - Whether or not the print dialog should be shown to the user. Default is true. [optional]

boolean landscape - Used to specify portrait (0) or landscape (1) mode. Default is portrait (0). [optional]

Return

boolean - True if the print job was successful.

.setColumnLabel(column, label)

Description

Used to set a column's header label to a new string at runtime.

• Parameters

int column - The column index that will get a new headel label.

```
String label - The new header label.
```

Return

None

.setColumnSelectionInterval(index0, index1)

Description

Sets the given range of columns to be selected. If index0==index1, it will select a single column.

Parameters

int index0 - the first index.

int index1 - the second index.

Return

boolean - True if selection range is valid.

.setColumnWidth(column, width)

Description

Used to set a column's width at runtime.

Parameters

int column - The index of the column.

int width - The width to set it at in pixels.

Return

None

.setRowSelectionInterval(index0, index1)

Description

Sets the given range of rows to be selected. If index0==index1, it will select a single row.

• Parameters

int index0 - The first index.

int index1 - The second index.

Return

boolean - True if selection range is valid.

.setSelectedColumn(column)

Description

Sets the given column to be the selected column.

Parameters

int column - Column to select.

Return

None

.setSelectedRow(row)

Description

Sets the given row to be the selected row.

Parameters

int row - Row to select.

Return

None

.setValue(row, column, value)

Description

Sets the value in the specified cell, altering the table's Data property. Will fire a propertyChange event for the "data" property, as well as a cellEdited event.

• Parameters

int row - The index of the row to set the value at.

int column - The index or name of the column to set a value at.

PyObject value - The new value to use at the given row/column location.

Return

None

.sortByColumn(columnName [, asc])

Description

Instructs the table to sort the data by the named column.

Parameters

String columnName - The name of the column.

boolean asc - 1 means ascending, 0 means descending. (default = 1) [optional]

Return

None

.sortOriginal()

Description

Instructs the table to clear any custom sort columns and display the data as it is sorted in the underlying dataset.

• Parameters

None

Return

None

.updateRow(rowIndex, changes)

Description

Updates an entire row of the table's dataset.

Parameters

int rowIndex - The index of the row to update.

PyDictionary changes - A sequence containing the updated values for the row. The length of the sequence must match the number of columns in the table, and each value must be coercible into the correct datatype of the corresponding column.

Return

None

Extension Functions

getBackgroundAt

Description

Called for each cell, returns the appropriate background color. Do not block, sleep, or execute any I/O; called on painting thread.

Parameters

Component self - A reference to the component that is invoking this function.

int row -The row index of the cell.

int col -The column index of the cell.

boolean isSelected - A boolean representing if the cell is currently selected.

Object value -The value in the table's dataset at index [row, col].

Color defaultColor -The color the table would have chosen if this function was not implemented.

Return

Color

getForegroundAt

Description

Called for each cell, returns the appropriate foreground (text) color. Do not block, sleep, or execute any I/O; called on painting thread.

Parameters

Component self - A reference to the component that is invoking this function.

int row -The row index of the cell.

int col -The column index of the cell.

boolean isSelected - A boolean representing if the cell is currently selected.

Object value -The value in the table's dataset at index [row, col].

Color defaultColor - The color the table would have chosen if this function was not implemented.

Return

Color

getDisplayTextAt

Description

Called for each cell, returns a String which will be used as the text of the cell. Do not block, sleep or execute any I/O; called on the painting thread.

Parameters

Component self - A reference to the component that is invoking this function.

int row-The row index of the cell.

int col-The column index of the cell.

boolean isSelected: A boolean representing if the cell is currently selected.

Object value-The value in the table's dataset at index [row, col].

String defaultText -The string the table would have chosen if this function was not implemented.

Return

String

Component Palette Icon:

Power Table

The power table is a more customizable version of the table component. The power table contains advanced features such as drag-and-drop rows, multi-column sorting, column filtering, and cell-spanning.

Power Table Features

- Multi-column sorting. To sort multiple columns, select the header of the first column, hold down the Control key, then select the header of the next column. Click on the header again to reverse the sort order, and click a third time to remove sorting on the column.
- Column filtering. Columns can be temporarily hidden from view using column filtering. Right-click on the header of the table, and uncheck columns that you would like to hide. You can disable this feature by disabling the Column Chooser Menu property on the table.
- Column reordering. You can switch the locations of columns on the table using column reordering. Drag the header of the column that you would like to move to a new location on the table. You can disable this feature by disabling the Columns Re-Orderable property on the table.
- Cell spanning. A cell can be spanned across multiple columns and rows. Keep in mind that you must explicitly define the locations of cells that must be spanned. This means that if you would like to use cell spanning, any other table features that change how the table is displayed will be disabled automatically (such as sorting, column filtering and column reordering). Click on the Cell Span Data dataset to configure spanning. Within the dataset, add a row for each new span. The "row" column controls the row in the table where the span will start. The "column" column controls the column where the span will start. The "width" column controls how many columns the span will cover. The "height" column controls how many rows the span will cover. Adding a row where "row=4, column=1, width=2, height=3" results in a span starting on the fifth row of the table and the second column (using 0-based indexing). The span will cover the second and third columns in the row and will also cover two rows below the fifth row, as shown below.
- Drag and Drop. This feature allows you to drag rows from one power table to another power table. In order to perform drag and drop, you must implement the onRowsDropped() extension function on the destination table. This is so that you can adapt the data from one table to the other within the function. You must also enable the Row Dragging Enabled property on both tables.
- Row Copying. This feature allows you to select rows and copy them to the clipboard using the standard keyboard shortcut Ctrl + C. These can then be pasted anywhere, even outside of Ignition.

Note: Even if a column is set to be editable, the edit must be handled by the onCellEdited extension function. If that extension function is not enabled and properly set up, the cell will revert back to its previous value.

Properties

Name	Description	Property Type	Scripting	Category
Auto Row Height	Enables automatic resizing of row height.	boolean	rowResizeE nabled	Behavior
Auto- Resize Mode	Determines how the table resizes the columns.	int	autoResize Mode	Behavior
Background Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearance

Examples

Code Snippet

```
#Example of an onRowsDropped() extension script for two power tables with identical columns:
def onRowsDropped(self, sourceTable, rows, rowData, dropIndexLocation):
    if self != sourceTable:
        destDataset = self.getData()
        pyRowData = system.dataset.toPyDataSet(rowData)
        \ensuremath{\texttt{\#}} Loop thru all the rows that have been selected and dragged to the
        # destination table.
        for row in pyRowData:
            newRow = []
            for column in row:
               newRow.append(column)
            destDataset = system.dataset.addRow(destDataset, dropIndexLocation, newRow)
        # Adds the rows to the destination table.
        self.setData(destDataset)
        # Optional. Deletes the dragged rows from the source table.
        sourceDataset = system.dataset.deleteRows(sourceTable.getData(), rows)
        sourceTable.setData(sourceDataset)
    else:
        system.gui.messageBox("Dropping on to same table not supported")
        # To drop onto the same table, the new row indices must be calculated
        # for both the dropped and deleted rows, taking changes into account.
```

Description

The Vision - Power Table offers the same functionality as the classic Vision - Table component, but has more features. Just like the classic Table, it not only provides a Table Customizer that allows you to make changes to the table columns, but coupled with its data properties and use of extension functions, it lets you configure how each cell in the table looks and behaves.

Customizers

The Table Customizer allows you to configure how you want the table to look to users. When you open the customizer, you'll notice that the data is formatted into different columns. The left column contains all the Table Customizer properties. For each column in the customizer, you can assign a header name, hide the column, make it editable and sortable, change the horizontal and vertical alignment of text, select a number format and date format style, and more.

(i) TestData Property

If you want to test how the Table Customizer works in the Power Table, drag a Power Table on to your workspace, go to the Test Data property in the Property Editor, and check the 'false' checkbox. It will automatically fill the table with some test data so you get test out the Table Customizer.

- Vision Power Table
- Component Customizers
- Understanding Component Customizers

Table Customizer Properties

Property	Description
Header	Provide a custom name to the column header.
Hide	Hides the column.
Editable	Allows the editing of the cell pertaining to the column. While the cell will be editable, the edit won't do anything and the cell will revert back to its previous value unless the edit is handled by the onCellEdited extension function.
Sortable	Allows the user to sort the table according to the selected column.
Filterable	Allows the user to filter the table according to the selected column.
Horiz Align	Aligns the contents of the column: Auto, Left, Center, Right.
Vert Align	Aligns the contents of the column: Top, Center, Bottom.
Wrap Text	The text will wrap if its contents are longer than the width of the cell.
Prefix	A custom text that proceeds the contents of each cell.
Suffix	A custom text that follows the contents of each cell.
Number Format	A format of the cell if the contents of the cell are number types.
Date Format	A format of the cell if the contents of the cell are date types.
Boolean	Changes the contents of the cell to reflect a 'check box' look and feel.

Power Table Customizer

In this example, compare the columns in the dataset and the table customizer to see how the individual columns were customized to create the chart below.

Vision - Power Table Scripting Functions

This page details the various component and extension functions available for Vision's Power Table component.

Component Functions

.getSelectedColumns()

Description

Returns a list of ints representing the currently selected columns.

Parameters

None

Return

Object of Integers - An object containing integers that represent the indices of the selected columns. Can be iterated over in a similar manner to a Python List.

.getSelectedRows()

Description

Returns a list of ints representing the currently selected rows.

Parameters

None

Return

Object of Integers - An object containing integers that represent the indices of the selected rows. Can be iterated over in a similar manner to a Python List.

.print([fitWidth], [headerFormat], [footerFormat], [showDialog], [landscape])

Description

This specialized print function will paginate the table onto multiple pages. This function accepts keyword-style invocation.

Keyword Args

boolean fitWidth - If true, the table's width will be stretched to fit across one page's width. Rows will still paginate normally. If false, the table will paginate columns onto extra pages. (default = true) [optional]

String headerFormat - A string to use as the table's page header. The substring "{0}" will be replaced with the current page number. (default = None) [optional]

String footerFormat - A string to use as the table's page footer. The substring "{0}" will be replaced with the current page number. (default = "Page {0}") [optional]

boolean showDialog - Used to determine if the print dialog should be shown to the user. Default is true. [optional]

boolean landscape - Used to specify portrait (0) or landscape (1) mode. Default is portrait (0). [optional]

Return

boolean - True if the print job was successful.

.setColumnWidth(column, width)

Description

Used to set a column's width at runtime.

Parameters

int column - Column to adjust.

- On this page ... **Component Functions** .getSelectedColumns() .getSelectedRows() .print([fitWidth], [headerFormat], [footerFormat], [showDialog], [landscape]) .setColumnWidth(column, width) **Extension Functions** • configureCell configureEditor configureHeaderStyle initialize isCellEditable onCellEdited

 - onMousePress
 - onMouseRelease
 - onMouseClick
 - onDoubleClick
 - onPopupTrigger
 - onRowsDropped

int width - Width in pixels.

Return

None

Extension Functions

configureCell

Description

Provides a chance to configure the contents of each cell. Returns a dictionary of name-value pairs with the desired attributes. Available attributes (and their Java types) include: 'background' (color), 'border' (border), 'font' (font), 'foreground' (color), 'horizontalAlignment' (int), 'iconPath' (string), 'text' (string), 'toolTipText' (string), 'verticalAlignment' (int).

You can also specify the attribute 'renderer', which is expected to be a javax.swing.JComponent which will be used to render the cell.

Parameters

Component self - A reference to the component that is invoking this function.

Object value - The value in the dataset at this cell.

string textValue - The text the table expects to display at this cell (may be overriden by including 'text' attribute returned in dictionary).

boolean selected - A boolean indicating whether this cell is currently selected.

int rowIndex - The index of the row in the underlying dataset

int collndex - The index of the column in the underlying dataset

string colName - The name of the column in the underlying dataset

int rowView - The index of the row, as it appears in the table view (affected by sorting)

int colView - The index of the column, as it appears in the table view (affected by column re-arranging and hiding)

Return

Dictionary of Attributes

configureEditor

Description

Provides a change to configure how each column is edited. Returns a dictionary of name-value pairs with desired editor attributes. Visual attributes to modify existing editors include: 'background', 'border', 'font', 'foreground', 'horizontalAlignment', 'toolTipText', and 'verticalAlignment'

If the attribute 'options' is specified, it is expected to be a list of tuples representing (value, label). The editor in this case will become a dropdown list.

If the attribute 'editor' is specified, it is expected to be an instance of javax.swing.table.TableCellEditor, and other attributes will be ignored.

The 'options' editor on the Power Table's configureEditor Extension Function accepts a rowHeight key allowing you to change the height of items in the dropdown. For example:

return {'options': [(0, 'Option A'), (1, 'Option B')], 'rowHeight':100}

Parameters

Component self - A reference to the component that is invoking this function

int collndex - The index of the column in the underlying dataset

string colName - The name of the column in the underlying dataset

Return

Dictionary of name value pairs

configureHeaderStyle

Description

Provides a chance to configure the style of each column header. Return a dictionary of name-value pairs with the designed attributes. Availible attributes include: 'background', 'border', 'font', 'foreground', 'horizontalAlignment', 'toolTipText', 'verticalAlignment'

Parameters

Component self - A reference to the component that is invoking this function

int collndex - The index of the column in the underlying dataset

string colName - The name of the column in the underlying dataset

Return

Dictionary of name value pairs

initialize

Description

Called when the window containing this table is opened, or the template containing it is loaded. Provides a chance to initialize the table further, for example, selecting a specific row.

Parameters

Component self - A reference to the component that is invoking this function

Return

None

isCellEditable

Description

Returns a boolean that determines whether or not the current cell is editable.

Parameters

Component self - A reference to the component that is invoking this function.

int rowIndex - Index of the row that was edited, relative to the underlying dataset.

int collndex - Index of the column that was edited, relative to the underlying dataset.

string colName - Name of the column in the underlying dataset.

Object value - The value at the cell location.

Return

boolean

onCellEdited

Description

Called when the user has edited a cell in the table. It is up to the implementation of this function to alter the underlying data that drives the table. This might mean altering the dataset directly, or running a SQL UPDATE query to update data in the database.

Note:

If the script on this extension function causes the Power Table to lose focus, the cell commit will occur twice. For example, if system.gui.confirm() is called, then two confirmation boxes will appear. In cases where the script will cause the focus to switch between multiple objects, the script should be placed in a function, and wrapped in a call to system.util.invokeLater().

```
def myFunction():
    """
    Do your work here
    """
    system.gui.messageBox("Assuming you don't change focus outside of this script\nYou will
only see this message once per cell edit")
    system.util.invokeLater(myFunction)
```

Parameters

Component self - A reference to the component that is invoking this function.

int rowIndex - Index of the row that was edited, relative to the underlying dataset.

int collndex - Index of the column that was edited, relative to the underlying dataset.

string colName - Name of the column in the underlying dataset.

Object oldValue - The old value at the location, before it was edited.

Object newValue - The new value input by the user.

Return

None

onMousePress

Description

Called when the user initially presses the mouse button on a table cell.

Parameters

Component self - A reference to the component that is invoking this function.

int rowIndex - Index of the row, starting at 0, relative to the underlying dataset.

int collndex - Index of the column starting at 0, relative to the underlying dataset.

Object value - The value at the location clicked on.

MouseEvent event - The MouseEvent object that caused this pressed event.

Return

None

onMouseRelease

Description

Called when the user releases the mouse button on a table cell.

Parameters

Component self - A reference to the component that is invoking this function.

int rowIndex - Index of the row, starting at 0, relative to the underlying dataset.

int collndex - Index of the column starting at 0, relative to the underlying dataset.

Object value - The value at the location that the mouse is released on.

MouseEvent event - The MouseEvent object that caused this released event.

Return

None

onMouseClick

Description

Called when the user clicks on a table cell.

Parameters

Component self - A reference to the component that is invoking this function.

int rowIndex - Index of the row, starting at 0, relative to the underlying dataset.

int collndex - Index of the column starting at 0, relative to the underlying dataset.

Object value - The value at the location clicked on.

MouseEvent event - The MouseEvent object that caused this click event.

Return

None

onDoubleClick

Description

Called when the user double-clicks on a table cell.

Parameters

Component self - A reference to the component that is invoking this function.

int rowIndex - Index of the row, starting at 0, relative to the underlying dataset.

int collndex - Index of the column starting at 0, relative to the underlying dataset.

Object value - The value at the location clicked on.

MouseEvent event - The MouseEvent object that caused this double-click event.

Return

None

onPopupTrigger

Description

Called when the user right-clicks on a table cell. This would be the appropriate time to create and display a popup menu.

Parameters

Component self - A reference to the component that is invoking this function.

int rowIndex - Index of the row, starting at 0, relative to the underlying dataset.

int collndex - Index of the column starting at 0, relative to the underlying dataset.

string colName - Name of the column in the underlying dataset.

Object value - The value at the location clicked on.

MouseEvent event - The MouseEvent object that caused this double-click event.

Return

None

onRowsDropped

Description

Called when the user has dropped rows on this table. The rows may have come from this table or another table. The source table must have dragging enabled.

Parameters

Component self - A reference to the component that is invoking this function

Component sourceTable - A reference to the table that the rows were dragged and dropped in the same table.
list rows - An array of the rows indices that were dragged, in the order they were selected

Dataset rowData - A dataset containing the rows that were dragged

int dropIndexLocation - Row index where the rows were dropped

Return

None

Examples

Code Snippet # This example will create a dataset, and assign the dataset to # the List component's Data property.

the hist component's bata property.
headers = ["my header"]
data = [["Thing 1"],["Thing 2"],["Thing 3"]]
dataset = system.dataset.toDataSet(headers, data)
Assign the dataset. The path below may need to change depending on

```
# Assign the dataset. The path below may need to change depending
# what component is triggering this script.
event.source.data = dataset
```

Code Snippet

```
# The following code will print the selected value to the console when called on the 'mouseClicked' event
handler.
value = event.source.getSelectedValue()
print(value)
```

Code Snippet

The following code uses setSelectedValues to set the selection on the component. # Assuming the List component contains string values of either "Thing 1" or "Thing 2", both items will be selected. # Build a Python list of things to check for in the List component valueList = ["Thing 1", "Thing 2"] # Locate the List component in the window, and call setSelectedValues, passing the valueList as an argument.

event.source.setSelectedValues(valueList)

Vision - List Scripting Functions

This page details the various component and extension functions available for Vision's List component.

Component Functions

.addSelectionInterval(start, end)

Description

Adds the options at indexes start through end (inclusive) to the selected options.

• Parameters

int start - The first index (stating at 0) to add to the selection.

int end - The last index (stating at 0) to add to the selection.

Return

None

.clearSelection()

Description

Clears the current selection, making nothing selected.

Parameters

None

Return

None

.getSelectedIndices()

Description

Returns a list of the selected indices in increasing order. Returns an empty list if nothing is selected.

Parameters

None

Return

List of Integers

.getSelectedValue()

Description

Returns the currently selected value, or None if the selection is empty.

Parameters

None

Return

Object

.getSelectedValues()

Description

Returns a list of the currently selected values. Returns an empty list if the selection is empty.

On this page ...

- Component Functions
 .addSelectionInterval(start, end)

 - .setSelectedValues(valueList)
- Extension Functions

- Parameters
 - None
- Return

Object[]

.isSelectedIndex(index)

Description

Checks whether or not the given index is currently selected.

Parameters

int index

Return

boolean

.isSelectionEmpty()

Description

Checks to see if anything is selected in the list or not.

• Parameters

None

Return

boolean

.setSelectedValue(value)

Description

Sets the currently selected value to the argument, if found in the list.

• Parameters

Object value

Return

None

The following feature is new in Ignition version **8.1.0** Click here to check out the other new features

.setSelectedValues(valueList)

Description

Sets the currently selected values in the component, selecting multiple options. The options selected are determined by the valueList parameter, which is expected to be a list of literal values that map to options in the list.

• Parameters

valueList Python list containing values that should map to options in the component.

Return

None

Extension Functions

This component does not have extension functions associated with it.

🐨 Tree View

The Tree View component can display any tree hierarchy. It is configured by filling in a dataset. Each column title in the dataset is a property of the Tree e View Customizer.

Each row in the dataset will become a node in the tree. Each node has a path that determines its location in the tree, for example, "West Area/Process /Valve1". The Separation Character property dictates how the paths are broken up. Any missing folder nodes needed by a leaf node are created implicitly. The other columns in the dataset besides "Path" are used to configure the look for the node, both when it is selected and when it is not. All column properties in the dataset are described in the Tree View Customizer.

Properties

Name	Description	Property Type	Scripting	Categor
Auto Expand	If true, the tree will automatically expand the tree structure up to the level specified by Auto Expansion Level.	boolean	.autoExpand	Behavior
Auto Expansi on Level	If Auto Expand is true, this is the depth level that will be expanded. Zero means expand-all.	int	autoExpansi onLevel	Behavior
Auto Sort	Whether or not to automatically sort the tree.	boolean	.autoSort	Behavior
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border .border		Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.

Scripting

See the Vision - Tree View Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

- Tree View Customizer
- Vision Component Customizers

Examples

Expression Snippet

```
//The Selected Item property will be updated as the user selects different nodes in the tree.
//It represents the index in the Items dataset at which the node is defined. If the selected
//node was implicitly created, the Selected Item will be -1.
//You can use this index to get the path and name of the selected node with an expression binding like this:
if ({Root Container.Tree View.selectedItem}<0,"n/a",{Root Container.Tree View.data}[{Root Container.Tree
View.selectedItem},"text"])
```

Description

The Tree View has its own customizer which allows you to easily configure the items dataset property. The customizer provides some useful dropdowns and color selectors for certain properties that require more than just a name or a path. You can add and remove nodes, and change the node hierarchy and appearance through the properties in the dataset.

While the Customizer allows you to configure the columns of the Items dataset, the customizer will not display any columns that the user adds to the dataset. However, user added columns are still configurable in the dataset itself, and can be used to store additional information about each item such as a window path.

Customizers

The Tree View Customizer allows you to easily configure how you want the tree view to look to users. When you open the customizer for the first time, you'll notice the dataset contains some predefined nodes and settings. Each row in the dataset represents a node in the tree. Each column in the dataset represents properties that configure the appearance of the tree to look a certain way.

Configuring the Tree View Customizer is very straightforward. To add a node to the tree, click the green icon on the right side of the window, and a new row will be added at the the bottom of the dataset. All the columns will default to the predefined properties with the exception of the "path" to the node's location. This field will be blank so you need to enter a path to the node. You can edit any of the of the preset properties. At a minimum, you should always edit the **Text** and **SelectedText** properties replacing the default names with a more appropriate name so the item is easily identifiable when it is selected and unselected in the tree. You can also move a node up or down the tree hierarchy using the **Move Up** or **Move Down** arrows on the right side of the window. To delete a node from the tree, simply select the node and hit **Delete**.

The additional properties are optional, but can enhance your tree view for your users. For example:

- To change an icon for any node in the tree, choose an icon from the Image Management Tool. All you need to do is right click on the icon in the Image Management tool and select Copy Path, and paste it in the Icon field for that node.
- Add a tooltip for any item in the tree by simply typing in your tooltip in the Tooltip field for that node. When you hover over the item in the tree view, you'll see your tooltip.
- Add a foreground and background color for any item in the tree when it is selected or unselected.
- Add a border for any item in the tree when it selected or unselected.

The references to optional properties in the table below means that a dataset does not need to have them present in the dataset for the tree to render and function.

Tree View Customizer Properties

Property	Description
Path	Path that determines the node's locaton. Broken up into a list by splitting on the separation character.
Text	Text of the node while not selected.
lcon	Path to an icon for the node. Use the value: "default" to use the tree automatic folder/leaf icons. (optional)
Background	Controls the background appearance of the unselected item. A string column that will be coerced into a color for the unselected background. (e.g., "white" or "(255,255,255)". Use an empty string to use the default color. (optional)
Foreground	Control the foreground appearance of the unselected item. A string representation of the unselected foreground color. (optional)
Tooltip	If not empty, will be use as the tooltip for the node. (optional)
Border	A string that will be coerced into a border for the node while unselected. May be empty. (optional)
SelectedTe xt	Text of the node while selected. (optional)
SelectedIc on	A path to an icon for the node while selected. Use the value: "default" to use the tree automatic folder/leaf icons. (optional)
SelectedB ackground	Controls the background appearance of the selected item. A string representation of the the selected background color. (optional)
SelectedFo reground	Controls the background appearance of the selected item. A string representation of the selected foreground color. (optional)
SelectedTo oltip	If not empty, will be used as the tooltip for the node while selected. (optional)
SelectedB order	A string that will be coerced into a border for the node while selected. May be emplty. (optional)

Example

Tree View with Larger Version of SelectedIcons

Below is an example configuration of the tree view's items property. Notice how not all of the fields listed in the property table above are used, because there are certain properties that are not necessary to build our tree view. A larger version of the images was chosen for the SelectedIcon, so that when an item gets selected, not only does the background color change, but the size of the image changes as well.

Path	Text	lcon	Background	Foreground	SelectedText	SelectedIcon	SelectedBackground	SelectedForeground
HMI Screens	Overview	Builtin/icons /16/home.png	color(255, 255, 255, 255, 255, 255)	color(0, 0, 0, 255)	Overview	Builtin/icons/24 /home.png	color(250, 214, 138, 255)	color(0,0,0,255)

Vision - Tree View Scripting Functions

This page details the various component and extension functions available for Vision's Tree View component.

Component Functions

.clearSelection()

Description

Clears the current selection.

• Parameters

None

Return

None

.collapseAll()

Description

Collapses all nodes in the tree.

• Parameters

None

Return

None

.expandAll()

Description

Expands all nodes in the tree.

• Parameters

None

Return

None

.getSelectedItems()

Description

Returns a list of the selected item's indexes. These are the row indexes that the selected tree nodes were found in the underlying dataset. Implicitly created folder nodes that have no index will not be included.

Parameters

None

Return

List of Integers

.getSelectedPaths()

Description

Returns a list of the selected item's paths. A path to an item is the path to its parent plus its normal (non-selected) text.

Parameters

None

On this page ...

- Component Functions
 - .clearSelection()
 collapseAll()
 - .collapseAll().expandAll()
 - .getSelectedItems()
 - .getSelectedPaths()
- Extension Functions

Return

List of Strings

Extension Functions

This component does not have extension functions associated with it.

 Customizers 					

Examples

The comments panel is used to power a blog-style comments system within your project. This can be useful for ad-hoc collaboration and communication between shifts, remote users, etc. This component is driven by a dataset that should be bound to a SQL query. Unlike most components, this component has built-in functionality to alter an external database. It expects three tables in the database, and that they are queried properly on the data property.

You can opt out of this three-table default system by enabling Extension Functions on the component. See below for more details.

1 The following section assumes the default configuration: all Extension Functions on the component are disabled.

Three-Table (Default) Configuration

Required Database Tables

The default behavior of the component expects three database tables be present under the same database connection, and each table needs to have certain columns with specific names.

Table: Notes

Stores all of the notes across the board.

Column Name	Description	Data Type
id	An auto-incrementing integer that is the primary key. This maps to the ID field in the dataset.	Integer
whoID	A mapping to the Username field in the dataset	Integer
tStamp	A mapping to the Timestamp field in the dataset	Date or Datetime
note	A mapping to the NoteText field in the dataset	Varchar
filename	A mapping to the AttachmentFilename in the dataset	Varchar
sticky	A mapping to the Sticky field in the dataset	Boolean or Integer
attachment	A column to hold the attachment data. LongBlobs do not exist in MSSQL, so a varbinary type must be used	LongBlob or Varbinary (depending on database)

Table: ItemNotes

Used to associate notes with other things. This allows you to have different sets of notes for different screens/objects.

Column Name	Description	Data Type
accountId	An automatically generated UUID for the Comment Panel instance. You can use the accountId in a WHERE clause on the data property so that the component only shows notes from a particular Comments Panel in the project.	Varchar
noteld	An integer that maps to the ID column on the Notes table	Integer

Tables: Users

A user mapping table that assigns an ID to each user on the table. This is easiest to do if a database authentication profile is used as the _users table automatically creates the required columns, but non-database authentication profiles can be used as long as the table is manually created and maintained.

Column Name	Description	Data Type
id	An integer that is inserted into the whoID column on the Notes table	Integer
username	The username of the user that created the note	Varchar

Configuring the Component

This component expects that its data property is populated with the following columns. The dataset in the Data property is very specific, and expects certain data types at precise positions. The order of **expected column positions** is listed below. Should the order of data types in the dataset differ from the order below, the names of the columns must match the **column names** below. Aliasing can be used to modify the names of the columns in the dataset.

The names do need to be exact, but different names can be used as long as the query that builds the dataset uses aliases. The data type for each column in your notes table must match the table below.

Column Name	Description	Data Type	Expected Column Position
id	an integer that should be the primary key for the notes table. Used for deleting and looking up attachments	integer	0
username	the user who added the note	string/varchar	1
timestamp	when the note was added	dateTime	2
notetext	The text of the note itself	string/varchar	3
attachmentname	filename for a file attached to the note	string/varchar	4
issticky	0 or 1 indicating whether or not the note is "sticky", which means it gets highlighted and put at the top	boolean or integer	5

Example

The following query returns note data from the above tables, and displays the data on a Comments Panel component. This query should be placed in a SQL Query binding on the Data property.

```
SELECT
notes.id,
users.username
as whoid,
notes.tstamp,
notes.note,
notes.filename,
notes.sticky
FROM
notes
JOIN users
ON notes.whoid =
users.id
ORDER BY
notes.tstamp DESC
```

By default, users can remove their own comments, and comments can have files attached.

Custom Configuration

Enabling the Extension Functions on the component will allow for custom functionality on the component. Some examples are:

- Store all note data on a single database table modify each Extension Function to run queries against a single database table
- · Save the attachment to a shared drive instead of a database column modify insertNote to save the attachment to a hard drive.
- Allow users to delete all notes by role check the role of the user in canDelete and return True if the user has a specific role.

Properties

Name	Description	Property Type	Scripting	Categor
Add Note Text	The word(s) used for the "Add Note" button.	String	addNoteText	Appearan
Attach File Text	The word(s) used for the "Attach File" link.	String	.attachText	Appearan
Attachm ents Enabled	Controls whether or not files can be attached to notes.	boolean	attachments Enabled	Behavior

Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Cancel Text	The word(s) used for the "Cancel" button.	String	.cancelText	Appearan
Data	Fill this DataSet in with the notes for the desired entity. Columns are: ID, Username, Timestamp, Note, Filename, IsSticky.	Dataset	.data	Data
Databas e Connecti on	Name of the database connection to run the queries against. Leave blank to use project's default connection.	String	.datasource	Behavior
Date Format	The format string to use for the date of the note.	String	.dateFormat	Appearan
Display Mode	Horizontal display mode will layout so that the comment header will be positioned to the left of the comment. Vertical display mode will have the comment header above the comment.	int	displayMode	Behavior
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.foreground	Appearan
Header Color	The background color of the header notes. See Color Selector.	Color	headersCol or	Appearant
Maximu m Attachm ent Size	The maximum attachment size in bytes that will be accepted. A value of 0 means no limit.	long	maxAttachm entSize	Behavior
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Note Color	The background color for notes. See Color Selector.	Color	.noteColor	Appearan
Padding	The amount of padding between the notes.	int	.padding	Appearan
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Skip Audit	If true, update queries originating from this component will skip the audit system. Can be important when attachments are turned on.	boolean	.skipAudit	Behavior
Sticky Header Color	The background color of the header for sticky notes. See Color Selector.	Color	stickyHeade rColor	Appearan
Sticky Note Color	The background color for sticky notes. See Color Selector.	Color	stickyNoteC olor	Appearan
Sticky Text	The word(s) used for the "Sticky" checkbox.	String	.stickyText	Appearan
Touchsc reen Mode	Controls when this input component responds if touchscreen mode is enabled.	int	touchscreen Mode	Behavior
Touchsc reen Keyboar d Layout	The following feature is new in Ignition version 8.1.28 Click here to check out the other new features	String	keyboardNa me	Behavior
	Sets the touchscreen keyboard layout to use for this component.			

Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecat	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

Scripting

See the Vision - Comments Panel Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

• Vision Component Customizers

Examples

↑↑ The following examples may need to be modified to match the table and column names in your database.

These examples are written for a MySQL database connection. If you are using a different database, some things may need to be changed. For example, using MS SQL Server requires:

- the python value None may not be used when inserting into a byte array. NULL must be used in its place.
- binary data must be converted to a varbinary type when inserting. See the examples below

insertNote: using default table configuration

```
# Inserts a note using the three default tables: notes, users, and itemNotes.
# Also stores only the file name in the database instead of the full path to the file.
# Assumes a User ID is used in the notes table.
# determine the ID for the logged in user
user = system.db.runScalarPrepQuery("SELECT id from users where username = ?", [system.security.
qetUsername()])
# determine if a file is being attached
if filename is None:
        # a file was not attached, provide a blank for the bytes
        attachmentBytes = None
else:
        # get the bytes of the file at the path the user selects
        attachmentBytes = system.file.readFileAsBytes(filename)
        # splits the file name from the file path. This way we can show just the file name on the component
        # Using '\' as a delimiter, but python requires two since it's an escape character
        pathAndFile = filename.rsplit('\\', 1)
        filename = pathAndFile[1]
# build the query
#MySOL query
query = "INSERT INTO Notes (note, whoid, tstamp, attachment, filename, sticky) VALUES (?, ?,
CURRENT_TIMESTAMP, ?, ?, ?)"
#MSSQL Server query
# We're converting the binary data into a VARBINARY data type, and checking for a NULL in the attachment
query.
#if attachmentBytes == None:
        query = "INSERT INTO Notes (note, whoid, tstamp, attachment, filename, sticky) VALUES (?, ?,
±
CURRENT_TIMESTAMP, NULL, ?, ?)"
#else:
        query = "INSERT INTO Notes (note, whoid, tstamp, attachment, filename, sticky) VALUES (?, ?,
#
CURRENT_TIMESTAMP, CONVERT(VARBINARY(MAX),?), ?, ?)"
# Set arguments and run the guery
arguments = [note, user, attachmentBytes, filename, sticky]
insertId = system.db.runPrepUpdate(query, arguments, getKey=1))
# insert a row onto the itemNotes table
# replace 'MYID' with the proper code - this is based on how you are dividing the notes.
# this ID could be an area, page, or machine code, or anything else that you may want to organize on.
myId = 'MYID'
system.db.runPrepUpdate("INSERT INTO ItemNotes (AccountId, NoteId) VALUES (?, ?)", [myId, insertId])
```

insertNote: using a single table

```
# Similar to the above example, but only a single database table is required.
# Assumes a User Name is used in the notes table.
# determine the name for the logged in user
user = system.security.getUsername()
# determine if a file is being attached
if filename is None:
        # a file was not attached, provide a blank for the bytes
        attachmentBytes = None
else:
        # get the bytes of the file at the path the user selects
        attachmentBytes = system.file.readFileAsBytes(filename)
        # splits the file name from the file path. This way we can show just the file name on the component
        \# Using '\' as a delimiter, but python requires 2 since it's an escape character
        pathAndFile = filename.rsplit('\\', 1)
        filename = pathAndFile[1]
# build the query
#MySQL query
query = "INSERT INTO Notes (note, whoid, tstamp, attachment, filename, sticky) VALUES (?, ?,
CURRENT_TIMESTAMP, ?, ?, ?)"
#MSSQL Server query
#We're converting the binary data into a VARBINARY data type, and checking for a NULL in the attachment
query.
#if attachmentBytes == None:
#
        query = "INSERT INTO Notes (note, whoid, tstamp, attachment, filename, sticky) VALUES (?, ?,
CURRENT_TIMESTAMP, NULL, ?, ?)"
#else:
#
        query = "INSERT INTO Notes (note, whoid, tstamp, attachment, filename, sticky) VALUES (?, ?,
CURRENT_TIMESTAMP, CONVERT(VARBINARY(MAX),?), ?, ?)"
# Set arguments and run the query
arguments = [note, user, attachmentBytes, filename, sticky]
system.db.runPrepUpdate(query, arguments)
```

Vision - Comments Panel Scripting Functions

This page details the various component and extension functions available for Vision's Comments Panel component.

Component Functions

This component does not have component functions associated with it.

Extension Functions

insertNote

Description

Called when a note is added.

Parameters

component self - A reference to the component that is invoking this function

string note - The text contents of the note

string filename - The full filepath to the the attachment

string sticky - A boolean indicating whether this note should be flagged as stickied

Return

None

deleteNote

Description

Called when a user clicks the 'delete' link on a note.

Parameters

component self - A reference to the component that is invoking this function

integer id - The id of the note

Return

None

unstickNote

Description

Called when a user clicks the 'unstick' link on a note.

• Parameters

component self - A reference to the component that is invoking this function

integer id - The id of the note

Return

None

downloadAttachment

Description

Called when a user attempts to download an attachment from a note.

Parameters

component self - A reference to the component that is invoking this function

On this page ...

- Component Functions
 - **Extension Functions**
 - insertNote
 - deleteNote
 - unstickNotedownloadAttachment
 - canDelete

integer id - The id of the note

Return

None

canDelete

Description

Returns whether or not a note with the given id can be deleted. Notes that return True will show a 'delete' link.

• Parameters

component self - A reference to the component that is invoking this function

integer id - The id of the note

Return

boolean - Notes with a True return can be deleted by the user, False return can not be deleted.

Vision - Tag Browse Tree

On this page ...

Component Palette Icon:

📳 Tag Browse Tree

The Tag Browse Tree component is similar to the Tag Browser in the Designer, allowing Tags to be browsed in both the Designer and the Client, and dragged on to other components like the Easy Chart. Unlike the Tag Browser, Tags can not be edited, Tag properties can not be displayed, and UDT definitions can not be displayed. Tags in the component can be refreshed through scripting by calling refresh().

Properties

Name	Description	Property Type	Scripting	Category
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation. This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Font	Font of text on this component.	Font	.font	Appearance
Include Historical Tags	Whether or not to display historical Tags.	boolean	showHistoric al	Realtime Tag Tree Settings
Include Realtime Tags	Whether or not to display non-historical Tags.	boolean	showRealtime	Realtime Tag Tree Settings
Mouseov er Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data

Root Node Path	The path of the root of this tree structure, or "" if no selection. When intentionally setting the root node, the exact syntax changes depending on what the Tag Tree Mode property is set to:	String	rootNodePath	Data
	Realtime Tag Tree: [TagProvider]FolderPath/			
	The example below is using the "default" Tag provider, and a folder named "machine_1"			
	Example			
	[default]machine_1/			
	Historical Tag Tree: [HistoricalProvider:/:GatewayName:TagProvider]FolderPath/ The example below is using a historical provider named "DB", the system name of the Gateway is "ignition", the Tag provider is "default" and will set the path to a folder named "machine_1". This example should work with both Datasource History Providers and DB Table Historian Providers.			
	Example			
	[DB:/:ignition:default]machine_1/			
	This feature was changed in Ignition version 8.1.10:			
	As of 8.1.10, the historical tag tree mode also accepts the following formats that will only work with DB Table Historian Providers:			
	histprov:HistoricalProvider:/drv:GatewayName:TagProvider:/tag:FolderPath/ histprov:HistoricalProvider:/drv:GatewayName:TagProvider [WistoricalProvider/GatewayName:TagProvider]FolderPath/			
Selected Paths	Contains the paths that should be selected on the tree which should be in the format of a single string column.	Dataset	selectedPaths	Data
Selection Mode	What kind of selection regions does the tree allow. Options are Single, Multiple - Contiguous, and Multiple - Discontiguous.	int	selectionMode	Behavior
Show Root Handles	Whether or not to show handles next to parent nodes.	boolean	showRootNo deHandles	Appearance
Show Root Node	Whether or not to show the root node of the tree.	boolean	showRootNo de	Appearance
Tag Tree Mode	Choose whether the tree is built using Tags from the default provider or the historical provider.	int	.treeMode	Appearance
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	d Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecated

Scripting

See the Vision - Tag Browse Tree Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Vision - Tag Browse Tree Scripting Functions

This page details the various component and extension functions available for Vision's Tag Browse Tree component.

Component Functions

This component does not have component functions associated with it.

On this page ...

- Component Functions
 - **Extension Functions**
 - filterTag

•

createPopupMenu

Extension Functions

filterTag

Description

Called for each Tag loaded into Tag browse tree. Return false to hide this Tag from the tree.

Note that this is called for each Tag, not any folders that appear in the component.

• Parameters

Component self- A reference to the component that is invoking this function.

Tag Object tag - The Tag itself.

Return

Boolean

createPopupMenu

Description

Returns a popup menu that will be displayed when the user triggers a popup menu (right click) on the tree. Use system.gui. createPopupMenu to create the popup menu.

Parameters

Component self- A reference to the component that is invoking this function.

Tag Object clickedTag - The Tag of the clicked on tree path.

List selectedTags - The Tags of the selected paths of the tree.

Return

JPopupMenu

Vision - Charts Palette

Chart Components

The following components give you various charts for displaying data.

In This Section ...

Vision - Easy Chart

Component Palette Icon:

This component is used to make runtime-configurable time-series charts. It is configured by defining a set of pens and axes. Pens can be many different styles, such as line, area, bar, and shape. This chart automatically creates controls for picking the time range and for hiding or displaying pens.

Features

- Easy configuration
- User-selectable set of pens
- Automatic time-selection controls
- SQL Query and/or SQLTags Historian data sources
- Automatic SPC and calculated pen support
- Zoom, Pan, X-Trace modes
- Any number of Y-axes and subplots
- Realtime or Historical

Pens

There are three kinds of pens in the Easy Chart:

- 1. Tag Historian Pens: These pens pull their data from the Historian system.
- 2. Database Pens: These pens will automatically create SQL SELECT queries to pull data from a database table. Typically, this is a table that is the target of a Historical Transaction Group.
- Calculated Pens: These pens display a calculated dataset based off another pen, such as a moving average or Statistical Process Control (SPC) function such as the Upper Control Limit (UCL).

Interface Elements

On this page ...

- Interface Elements
- Properties
- Scripting
- Évent Handlers Customizers

Element	Description
Pens	After dragging a tag onto the Easy Chart, a Pen corresponding to the tag's value will appear in the Pens panel. Pens can be selected and deselected using the checkboxes. Clicking the X next to a pen will remove it from the Easy Chart.
Date Range	In Historical mode, the user is shown a Vision - Date Range component to pick the range of data to fetch and display. The initial values of this component are set through properties on the chart. In historical mode, the chart does not poll.
	In Realtime mode, the user is instead given the ability to select an amount of time before the current timestamp: Last: 5 Minutes Image: Comparison of the current timestamp:
	The chart will poll at a rate according to the Poll Rate parameter.
	In Manual mode, no user input controls are displayed. The chart will use the values of its Start Date and End Date parameters to govern what data is displayed. The chart will poll at a rate according to the Poll Rate parameter.
Maximize	Clicking this button will maximize the chart to fill the area of the component.
Print	Clicking this button will print the chart.
Save to Excel	Clicking this button will save the chart data as an Excel spreadsheet.

Note: You can bring up a context menu for this component when right-clicking on it either in the Designer's Preview Mode or in a Vision Client. See the Charting - Right Click Menu page for more details.

Properties

Name	Description	Property Type	Scripting	Categor
3D X Offset	The offset to use in the x direction for the '3D Line' pen style.	int	.xOffset3D	Pen Style Options
3D Y Offset	The offset to use in the y direction for the '3D Line' pen style.	int	.yOffset3D	Pen Style Options
Allow Color Changes	If true, pen colors can be set to different values.	boolean	allowColorC hanges	Behavior
Allow Tag History Interpola tion	If enabled and the query mode is not raw, the data will be interpolated for time spans with no data available.	boolean	tagHistoryAll owInterpolat ion	Tag Histor
Auto Apply	If true, user changes to pen visibility will occur immediately.	boolean	.autoApply	Behavior
Auto Axis Positioni ng	If true, axes alternate automatically between left and right, rather than being placed explicitly.	boolean	autoPosition Axes	Behavior
Auto Color List	The list of colors to use if auto pen coloring is enabled.	Color[]	autoColorList	Behavior
Auto Pen Coloring	If true, pens are assigned different colors automatically.	boolean	autoColorPe ns	Behavior
Axes	This Dataset defines all axes that can be used by the pens.	Dataset	.axes	Chart Configurat
Axis Font	The font for axis labels.	Font	axisLabelFo nt	Appearan
Backgro und Color	The background color of the component. See Color Selector.	Color	.background	Appearan
Bar Margin	The margin to use for the 'Bar' pen style.	double	.barMargin	Pen Style Options
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Appearan
	Note: The border is unaffected by rotation.

	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Box Fill	For historical-mode date range. The fill color for the selection box. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.boxFill	Historical Range
Button Size	The size of the utility button icons.	int	utilityButton Size	Utility Buttons
Bypass Tag History Cache	If true, tag history queries will not use the client history cache.	boolean	tagHistoryB ypassCache	Tag Histor
Calculat ed Pens	This Dataset defines the calculated pens for the chart.	Dataset	.calcPens	Chart Configurat
Chart Border	The border for the chart itself.	Border	.chartBorder	Appearan

Chart Mode	Affects the mode th	nat the chart operates in; Mar	nual Mode, Historical Mode, Realtime Mode.	int	.chartMode	Behavior
	Integer Value	Corresponding Mode				
	0	Manual				
	1	Historical				
	2	Realtime				
Chart Title	Sets an optional titl	e to be displayed above the	chart.	String	.title	Appearan
Cursor	The mouse cursor t Move, SW Resize,	to use when hovering over th or SE Resize.	nis component. Options are: Default, Crosshair, Text, Wait, Hand,	int	.cursorCode	Common
DB Pens	This Dataset define	es all of the database pens fo	or the chart.	Dataset	.pens	Chart Configurat
Date Editor Backgro und	The background co	olor for the date editor. See C	Color Selector.	Color	editorBackgr oundColor	Appearan
Date Editor Foregro und	The foreground col	or for the date editor. See Co	olor Selector.	Color	editorForegr oundColor	Appearan
Date Range	Affects the position	of the date range control.		int	dateRangeL ocation	Layout
Date Range Border	The border for the o	date range control, if visible.		Border	dateRangeB order	Appearan
Date Style	The style to display	v dates in. For international s	upport.	int	.dateStyle	Historical Range
Digital Gap	The size of the gap	to use between digital pens		double	.digitalGap	Pen Style Options
Empty Group Name	The group name to	use for pens that are not in	a pen group.	String	emptyGroup Name	Behavior
End Date	For manual-mode.	The end date to use for sele	cting pen data	Date	.endDate	Data
Font	Font of text on this	component.		Font	.font	Appearan
Foregro und Color	The foreground col	or of the component. See Co	blor Selector.	Color	.foreground	Appearan
Gap Threshold	The relative thresho	old to use for determining co	ntinuity breaks for the 'Discontinuous Line' pen style.	double	gapThreshold	Pen Style Options
Gridline Color	The color of the grid	dlines. See Color Selector.		Color	gridlineColor	Appearan
Gridline Dash Pattern	Enter a string of commeans three pixels	mma-delimited numbers white on, five pixels off.	ch indicate the stroke pattern for a dashed line. For instance, "3,5"	String	gridlineDash Pattern	Appearan
Gridline Width	The width (thicknes	ss) of the gridlines.		float	gridlineWidth	Appearan
Group Pens	If true, pens will be	grouped by their group name	е.	boolean	penGrouping	Behavior
High Density Color	For historical-mode	e date range. The color used	to indicate high data density. See Color Selector.	Color	highDensity Color	Historical Range
Horiz Gap	The horizontal space	cing to use for the pen check	boxes.	int	.hGap	Layout
Ignore Bad Quality Data	If true, causes the s	system to ignore any bad qua	ality data.	boolean	tagHistoryIg noreBadData	Tag Histor
Invert Time Axis	If true, the time axis Orientation.	s values will increase from th	e right to left or from top to bottom depending on the Plot	boolean	invertTimeA xis	Layout
Legend	Where the legend s	should appear, if any.		int	.legend	Layout

Max Selection	For historical-mode date range. The maximum size of the selected date range.	String	maxSelectio nSize	Historical Range
Maximiz e Plot	If true, displays maximized plot.	boolean	currentlyMa ximized	Layout
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Outer Range End	For historical-mode date range. The end date for the outer range. Used in cases when an explicit point in time should be used to define the outer range of the chart. Competes with Startup Range.	Date	outerRange End	Historical Range
Outer Range Start	For historical-mode date range. The start date for the outer range. Used in cases when an explicit point in time should be used to define the outer range of the chart. Competes with Startup Range.	Date	outerRange Start	Historical Range
Pen Control Border	The border for the pen control panel, if visible.	Border	.penBorder	Appearan
Pen Control Mode	The style in which the pen control panel alters the chart configuration. In heavyweight mode, unchecked pens are not queried, so checking and unchecking pens refreshes the chart. In lightweight mode, all pens are constantly queried, so checking and unchecking pens is quick.	int	penControl Mode	Behavior
Pen Control?	Controls whether or not end-users can turn on and off pens.	boolean	allowPenMa nipulation	Behavior
Plot Backgro und	The background color for all plots, unless they override it. See Color Selector.	Color	plotBackgro und	Appearan
Plot Orientati on	The plot orientation for all plots.	int	plotOrientati on	Layout
Plot Outline	The color to use for the plot outline. See Color Selector.	Color	plotOutlineC olor	Appearan
Poll Rate	The rate (in milliseconds) at which this chart's queries poll. Historical charts don't use this property.	int	.pollRate	Behavior
Properti es Loading	The number of properties currently being loaded. (Read only. Usable in bindings and scripting.)	int	propertiesLo ading	Uncatego ed
Realtime Text	For realtime-mode date range. The text to display on the realtime date control.	String	.rtLabel	Realtime Range
Selected X Value	The selected domain axis value for X-Trace and Mark modes. (Read only. Usable in bindings and scripting.)	String	selectedXVa lue	Uncatego ed
Selectio n Highlight	For historical-mode date range. The focus highlight color for the selection box. See Color Selector.	Color	selectionHig hlight	Historical Range
Show Density	For historical-mode date range. If true, a data density histogram will be shown in the date range.	boolean	showHistogr	Historical Range
	Note: This feature relies on being able to validate the data against tag group execution. This chart will be unable to display density information for tags that were stored by an Internal Historian Provider, as well as cases where tag group validation is disabled (such as by disabling Enable Stale Data Detection)		am	
Show Loading	If true, an animated indicator will be shown when data is loading.	boolean	showLoading	Behavior
Show Maximiz e Button?	If true, a small maximize button will be displayed next to the chart.	boolean	showMaximi ze	Utility Buttons
Show Popup?	If true, a popup menu will be shown on right-click that allows the user to change mode, print, save, etc.	boolean	.showPopup	Behavior
Show Print Button?	If true, a small print button will be displayed next to the chart	boolean	.showPrint	Utility Buttons
Show Save Button?	If true, a small save button will be displayed next to the chart.	boolean	.showSave	Utility Buttons

Show Tooltips?	If true, tooltips showing point values will be displayed on the chart.	boolean	.tooltips	Behavior
Show Warnings	If true, warnings generated during chart configuration will be printed to the console.	boolean	showWarnin gs	Behavior
Sort Pens	If true, pens visibility checkboxes will be sorted.	boolean	alphabetize Pens	Layout
Start Date	For manual-mode. The start date to use for selecting pen data.	Date	.startDate	Data
Startup Range	For historical-mode date range, this will be the starting range of time available for selection. Useful in cases where the chart should range a period of time on window open (i.e., show the last 8 hours). Competes with the Outer Range Start and Outer Range End properties.	String	startupRange	Historical Range
Startup Selection	For historical-mode date range, this value will be used for the starting selection range.	String	startupSelec tion	Historical Range
Subplot Gap	The gap between subplots.	double	.subplotGap	Layout
Subplots	This Dataset defines all subplots' relative size and color.	Dataset	.subplots	Chart Configura
Tag History Resoluti on	When Tag History Resolution Mode is set to "Fixed", this setting is used to specify the number of the number of data points that should be returned by tag history queries. When a tag history provider has pre-processed partitions enabled, this setting can be used in conjunction with the chart's range to specify if the tag history data should use pre-processed partitions or not. For example, if the chart is displaying a range of 60 minutes, and resolution is set to 6, Setting this to -1 is equivalent to using the Raw Resolution Mode. Setting this to 0 is equivalent to using the Natural Resolution Mode.	int	tagHistoryR esolution	Tag Histor
Tag History Resoluti on Mode	The mode used for the number of requested points. Fixed will use the Tag History Resolution Size, Natural will return a value per tag group execution, Chart Width will be based on the actual width of the chart component, and Raw will be the raw data.	int	tagHistoryR esolutionMo de	Tag Histor
Tag Pens	This Dataset defines all of the Tag History pens for the chart.	Dataset	.tagPens	Chart Configura
Tick Density	For historical-mode date range. This is multiplied by the width to determine the current ideal tick unit.	float	.tickDensity	Historical Range
Tick Font	The font for tick labels.	Font	axisTickLab elFont	Appearan
Time Style	The style to display times of day. For international support.	int	.timeStyle	Historical Range
Title Font	The font for the optional chart title.	Font	.titleFont	Appearan
Today Color	For historical-mode date range. The color of the "Today Arrow" indicator. See Color Selector.	Color	todayIndicat orColor	Historical Range
Total Datapoin ts	The number of datapoints being displayed by the graph. (Read only. Usable in bindings and scripting.)	int	.datapoints	Uncatego ed
Track Margin	For historical-mode date range. The amount of room on either side of the slider track. May need adjusting of default font is changed.	int	.trackMargin	Historical Range
Unit	For realtime-mode date range. The selected unit of the realtime date control.	int	.unit	Realtime Range
Unit Count	For realtime-mode date range. The number of units back to display.	int	.unitCount	Realtime Range
Validate Scan Class Executio ns	Causes the tag history query to verify the scan class execution records, generating bad data for the time periods where the scanclasses did not execute.	boolean	tagHistoryV alidateScan class	Tag Histor
Vert Gap	The vertical spacing to use for the pen checkboxes.	int	.vGap	Layout
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Where Clause	A snippet of where clause that will be applied to all pens, like "TankNum = 2".	String	globalWhere Clause	Data

X Axis AutoRan ge?	If true, the X axis will automatically fit the range of available data, if false, it will display a fixed range based on the start date and end date.	boolean	xAxisAutoR ange	Behavior
X Axis Label	The label shown on the X Axis (time axis).	String	.xAxisLabel	Appearan
X Axis Margin	A margin for the upper and lower ends of the x axis, expressed as a percentage of the total range.	double	xAxisMargin	Behavior
X Axis Visible	Should the x-axis be displayed?	boolean	.xAxisVisible	Appearan
X-Trace Large Number Format	The large decimal format for the x-trace value in the Easy Chart.	String	xTraceLarge NumberFor mat	Appearan
X-Trace Number Format Threshold	If the magnitude of the to-be-formatted value is below this threshold, then the X-Trace Small Number Format will be used.	double	xTraceNum berFormatT hreshold	Appearan
X-Trace Small Number Format	The small decimal format for the x-trace value in the Easy Chart.	String	xTraceSmall NumberFor mat	Appearan
X-Trace Track Mouse	If set enabled, and the chart is set to X-Trace mode, the X-Trace will auto track the mouse position while the cursor is over the component. This is particularly useful when displaying the Easy Chart on a touchscreen.	boolean	XTraceTrac kMouse	Appearan
	This feature was changed in Ignition version 8.1.15:			
	xTraceTrackMouse and XTraceTrackMouse can be used interchangeably to read/write to the property.			

Scripting

See the Vision - Easy Chart Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

Refer to the Vision - Easy Chart Customizer and the Using the Vision Easy Chart sections of the manual for examples and tutorials on how to use the Easy Chart Customizer. With the customizer, you can set up:

- Axes
- Subplots
- Pen Groups
 Pen Display
- Offsets
- Calculated Pens
- Ad-Hoc ChartingIndirection
Vision - Easy Chart Customizer

Description

The Easy Chart component allows you to display the history of your Tags on a chart. When you drag and drop Tags onto an Easy Chart, it automatically trends the data for you. It has a special customizer that has some default settings to help you get started.

Customizers

The Easy Chart Customizer allows you to easily modify the chart to your own style. You can add pens and modify the contents of your pens, and create new axes, subplots, and pen groups. When you open the customizer, you'll notice four tabs at the top of the window: Pens, Axes, Subplots, and Dynamic Groups. Each have their own properties.

Shown below is each tab in the Easy Chart Customizer listing all its properties along with a brief description.

The Pens tab is where you can add new pens, create custom names for your pens, and group pens. There are three types of pens, and each functions in a similar manner, but what makes them different is how their data is collected. Each pen type has a few unique properties and is listed at the bottom of the table.

- Tag pens Pens are driven by the Tag history system. (Data from any historical provider can be used).
- Database pens Pens that are driven by an SQL query. They can query for data in any connected SQL database.
- Calculated pens Pens that derive their data from calculations performed on other pens.

Action	Description
\mathcal{P}	Add pen (Browse for Tags).
.	Add a pen manually.
X	Edit pen.
×	Delete pen.

Property	Description			
Edit Pen P	Edit Pen Panel			
Name	The name of the pen is what the user will see in the legend and the pen panel.			
Enabled	Enabled If false, this pen will not show up on the chart and the data will not be generated. The user will be able to enable it via the pen control panel.			

Hidden	If true, the pen will not show up on the chart or the pen control panel. The data will be generated.
User Selectable	If false, the pen will show up on the chart, but not the pen control panel.
Axis	Select the Y axis this pen will use.
Subplot	Putting pens on separate subplots can increase chart clarity.
Group Name	The group name is used for logical grouping in the pen panel and for advanced dynamic grouping.
Digital Offset	If true, a small gap will be placed between this and other digital pens so they don't overlap each other.
Color	Pen color.
Style	The style of the pen determines how it looks in the chart.
Dash Pattern	Uses a dash pattern like "5,5" to specify 5 pixels on, 5 pixels off.
Line Weight	The thickness of the pen's line.
Shape	If the renderer style uses shapes, this will be the shape for each point.
Fill Shape	If true, the shape will be filled in rather than an outline.
Labels	If true, shows a label of the value above each bar.
Preview	Field where you can view the pen style.
Tag History	/ Pens Properties
Tag Path	String-based path where the Tag is located.
Aggregatio n Mode	Type of calculation. See Aggregation Mode for more details.
Database F	Pens Properties
Volume Column	The name of the column for the pen's value (Y value).
Time Column	The name of the column for the pen's timestamp (X value).
Table Name	The name of the table where the pen will be found.
Datasource	The name of the datasource to use for this pen (MySQL).
Where Clause	You can specify a snippet of WHERE clause here, like "TankNum = 16."
Run Diagnostics	Test this pen for data configuration for validity.
Calculated	Pens Properties
Function	Function is the type of calculation (i.e., Constant, UCL, UWL, Avg, LWL, LCL, MovingAvg, Multiply, Min, Max).
Driving Pen	Dedicated pen that will drive the value.
Parameter	Value which is the horizontal line drawn on the graph. The parameter type can be different for the Function used:
	 Constant Value - constant value of the pen.(Used with the Constant function). Window Size - the size of the moving average window, specified as a multiplier of the chart's date range. It's the percentage of time that you're going to do the moving average on. (Used with MovingAvg function). Factor - multiply by 'X' factor (Used with Multiply function). Secondary pen - another pen added to the chart to show the sum and/or the difference. (Used with the Sum and Difference functions).

 Easy Chart Calculated Pens
 Using the Vision Easy Chart

The Axes tab is where you can configure multiple axes on the Easy Chart component.

Property	Description
Name	The name of the axis is what pens use to refer to it.
Label	The label will be displayed on the chart next to the axis.
Туре	The type of axis determines the plotting behavior. (i.e., Numeric, Logarithmic, Symbol)
Position	The position of the axis, if automatic, axis positioning is turned off.
Label Color	Color of the label.
Tick Label Color	Color of the tick label.
Tick Color	Color of the tick mark.
Axis Inverted	If true, inverts the axis.
Auto Range	If true, the axis will automatically scale itself to the data, rather than display a fixed range.
Auto Range Incl Zero	If true, forces the auto range to include zero.
Auto Range Margin	The extra margin (as percent of the total range) for the top and bottom of an auto range axis.
Lower Bound	The lower bound of a non-auto-ranging axis.
Upper Bound	The upper bound of a non-auto-ranging axis.
Auto Tick Units	If true, the distance between the tick marks and the gridlines will be automatically calculated rather than a fixed number.
Tick Units	If false, this amount will be used as the distance between tick marks.
Gridline Units	If false, this amount will be used as the distance between gridlines.
Number Format Override	Specifies a number format pattern to use for tick labels. Leave blank for automatic number formatting.

) In the Pens Tab			
In the Pens Tab Once you add a	subplot, go to the Pens Tab, edit your p	pen, and put your pen into a different	subplot.

Dynamic Groups are used with Database pens. They allow you to apply a dynamic condition, like using a WHERE clause, to a subset of pens. For each pen group, a dynamic string property will appear in the Property Editor under Custom Properties of your Easy Chart component. You can create a WHERE Clause that will search the database and return values if the pens meet a true condition.
🖌 Easy Chart Customizer
Mens 🗋 Axes 🔄 Subplots Dynamic Groups
Dynamic groups give you the opportunity to apply a dynamic condition to a subset of your pens. For each pen group X listed here, a dynamic string property will appear on your chart component, affording you the ability to provide a snippet of WHERE clause for that group. X

Vision - Easy Chart Scripting Functions

This page details the various component and extension functions available for Vision's Easy Chart component.

Component Functions

exportExcel(filename)

Description

This function save the chart's datasets as an Excel file. Returns a String of the complete file path chosen by the user, or None if the user canceled the save.

Parameters

String filename - The default file name for the Save dialog.

Return

String

print()

Description

This function will print the chart.

Parameters

None

Return

None

setMode(mode)

Description

Sets the current mode for the chart.

Parameters

Int mode - The mode to set the chart to. The mode options are as follows:

 $\ensuremath{0}$: Zoom Mode. This is the default mode, where the user can draw a zoom rectangle with the mouse pointer.

1 : Pan Mode. This mode lets the user use the mouse pointer to pan the chart to the left and right.

3 : Mark mode. This mode lets the user click near a datapoint to annotate the point with its ${\sf X}$ and ${\sf Y}$ value.

 $4: X\mbox{-}Trace$ mode. This mode lets the user click and drag on the chart to see all values that fall along that X value.

Return

None

exportDatasets()

Description

Returns an Array List of datasets, representing the time series data of each type of pen.

Parameters

None

On this page ...

- Component Functions
 - exportExcel(filename)
 - print()setMod
 - setMode(mode)exportDatasets()
- Extension Functions
 - configureChart
 - getXTraceLabel
 - onPowerTableRowsDropped
 - onTagsDropped

Return

Array List of datasets. Each dataset represents timeseries data for set of pens. The order of the datasets are listed below.

Index order of datasets

Index	Dataset
0	Tag Pens
1	Calculated Pens
2	Database Pens

Python - Accessing the Tag Pens Dataset

```
# This example will extract the Tag Pens series data that is already present in an Easy Chart, and
pass it to a Power Table on the same window.
# This script could be placed on the Easy Chart's propertyChanged event.
# Filter on the name of the property
if event.propertyName == 'tagPens':
    # Wrap our dataset behavor in a function, so we can pass it to system.util.invokeLater
    def func():
        chart = event.source
    # Extract the datasets
        datasets = chart.exportDatasets()
        # Pass the first dataset (index 0 contains data for Tag Pens) to the Power Table
        event.source.parent.getComponent('Power Table').data = datasets[0]
    # Using invokeLater to provide a delay. We want this to run after the chart has finished
loading the new tag.
        system.util.invokeLater(func, 1000)
```

Extension Functions

configureChart

Description

Provides an opportunity to perform further chart configuration via scripting. Doesn't return anything.

Parameters

Component self - A reference to the component that is invoking this function.

JFreeChart chart- A JFreeChart object. Refer to the JFreeChart documentation for API details.

Return

None

getXTraceLabel

Description

Provides an opportunity to configure the x-trace label. Return a string to override the default label.

Parameters

Component self - A reference to the component that is invoking this function.

JFreeChart chart - A JFreeChart object. Refer to the JFreeChart documentation for API details.

String penName - The name of the pen the x-trace label applies to.

int yValue - The y-value of the pen at the x-trace location.

Return

None

onPowerTableRowsDropped

Description

Called when the user has dropped rows from a Power Table on the chart. The source table must have dragging enabled.

• Parameters

Component self - A reference to the component that is invoking this function.

Component sourceTable - A reference to the table that the rows were dragged from.

List rows - An array of the row indicies that were dragged, in the order they were selected.

Dataset rowData - A dataset containing the rows that were dragged.

Return

None

onTagsDropped

Description

Called when the user has dropped tags from the tag tree onto the chart. Normally, the chart will add pens automatically when tags are dropped, but this default behavior will be suppressed if this extension function is implemented.

Parameters

Component self - A reference to the component that is invoking this function.

List paths - A list of the tag paths that were dropped on the chart.

Return

None

Example - Pen Name Replacement

```
#This will take a tag that gets dropped from a Tag Browse Tree set in Realtime Tag Tree mode,
#and will replace the underscores in the name of the tag "_" and replace them with spaces.
tagPens = self.tagPens
for tag in paths:
        tagPath = tag.replace("default", "~")
        splitTag = tag.split("/")
        name = splitTag[-1].replace("_", " ")
        newRow = [name, tagPath, "MinMax", "Default Axis", 1, 1, system.gui.color(255, 85, 85, 255), "", 1,
1, 0, 1, 0, "", 0, 0, 0, 1, 0, 0]
        self.tagPens = system.dataset.addRow(tagPens, newRow)
```

Vision - Chart

Component Palette Icon:

The Chart component (also called the Classic Chart when contrasted with the Easy Chart) provides a flexible way to display either timeseries or X-Y charts that are powered by any number of datasets. Typically, these datasets are bound to SQL Query Bindings in Vision.

Features

- SQL Query and/or SQLTags Historian data sources
- Zoom, Pan, X-Trace modes
- Any number of Y-axes and subplots
- Realtime or Historical
- · Many different rendering styles

Configuration

The basic idea behind configuring the classic chart is simple: add datasets, and fill them in with data in a format that the chart understands. You can add datasets to the chart using the chart's customizer. You then use standard property bindings to put data into these charts. Commonly you'll use a S QL Query Bindings in Vision. Since these datasets are just normal dynamic properties, you can also access them via scripting.

The Customizer also lets you add additional X and Y axes. There are various types of axes, and they each have a large number of properties. You can configure additional properties for each dataset, such as which axes it maps to, its visual style, subplot, etc.

Datasets

Each dataset should define one or more "series" (a.k.a "pens"). Each series in a dataset shares common X-values, defined by the first column. Each additional column are the Y-values for a series.

Chart Type: XY vs Category

The classic chart is typically in XY Plot mode. This means that the X-axis is either date or numeric, and the Y-axes are numeric. If your X-axis is categorical (names, not numbers), you can switch the Chart Type property to Category Chart in the Property Editor. Don't be surprised when you get a few errors - you'll need to go and switch your X-axis to be a Category Axis, and fill your dataset in with valid category data, that is, String-based X-values. This is most often used with the Bar Renderer (see the Vision - Chart Customizer).

Note: You can bring up a context menu for this component when right-clicking on it either in the Designer's Preview Mode or in a Vision Client. See the Charting - Right Click Menu page for more details.

Properties

Quality				

Scripting

See the Vision - Chart Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

The Chart component uses its own customizer called the Vision - Chart Customizer. You can add datasets and additional XY axes to a chart using the tabs in the chart customizer. You can configure additional properties for each dataset, like what axes it maps to as well as select from a host of visual styles. It also has six axis types to choose from, each with an extensive list of properties.

The customizer already has some default styles in place to help you get started, but you can modify these default settings to your own style. Refer to the Vision - Chart Customizer section for property descriptions and examples of chart axis types.

Description

The Chart component, also known as the Classic Chart, can be used to make almost any kind of chart. It provides a flexible way to display XY charts using a host of built-in properties. All you need to do to create a chart is add datasets, fill them in with data, configure a property binding, and set up the chart properties using the customizer.

Customizer

The Chart component has its own special customizer called the Chart Customizer. When you open the customizer, you'll notice five tabs at the top: Dataset, X-Axes, Y-Axes, Dataset Properties, and Plot Properties. Each tab has its own set of properties and defaults.

To get started, first add your dataset(s) and any additional XY axes using the appropriate tabs in the customizer. You can configure additional properties for each dataset, like what axes the data maps to, as well as select from a host of visual styles.

There are six types of axes to choose from when configuring a chart, each having its own list of properties: Number Axis, Date Axis, Category Axis, Logarithmic Axis, Elapsed Axis, and Symbols Axis. Most of the X and Y axes properties are used in the customizer, and some properties are specific to the axis type and have their own unique properties

The customizer already has some default styles in place to help you get started, but you can modify these default settings to your own style using the XY properties, Axes Type, Renderer and Plot styles. If you don't like one style, try another.

Shown below is each tab in the Chart Customizer with all its properties, description, and what axes type it supports. Note: Not all properties are available for all axes type charts.

The Dataset tab is where you set up, add, and remove datasets.

🧹 Chart	Customizer						->	٢

Axis Type Examples

The Chart Customizer has six different axis types to choose from when configuring a chart, each with its own list of properties. Note: Some customizer properties are specific to the axis type and have their own unique properties. Examples of all axis types are shown below along with the property settings used to create each chart.

Vision - Chart Scripting Functions

This page details the various component and extension functions available for Vision's Chart component.

Component Functions

getPlotProperties()

Description

Retrieves the value of the selected $\mathsf{PlotProperty}$ objects that define background color and weight of each plot.

Parameters

None

Return

List

getProperties()

Description

Retrieves the value of custom properties added to the Chart.

• Parameters

None

Return

List

getSelectedData()

Description

Returns the value of the selected chart entity as a string.

Parameters

None

Return

String

getSelectedEntity()

Description

Returns the selected chart entity directly.

• Parameters

None

Return

ChartEntity

getSubplotMode()

Description

Retrieves the subplot mode that is currently in use:

- 0 = Shared Domain
- 1 = Shared Range
- Parameters

On this page ...

- Component Functions
 getPlotProperties()
 - getProperties()
 - getSelectedData()
 - getSelectedEntity()
 - getSubplotMode()
 - getXAxes()
 - getYAxes()
 - refreshChart()
 - setDatasetEnabled()setDatasetPlotNumber()
 - setDatasetXAxis()
 - setDatasetYAxis()
 - setSubplotMode()
 - setXAxes()
 - setYAxes()

٠

- Extension Functions
- configureChart
- getXTraceLabel

None

Return

Int

getXAxes()

Description

Returns a dictionary of the related rendering properties.

• Parameters

None

Return

Dictionary<String, AxisConfig> - AxisConfig is an object that defines rendering properties

getYAxes()

Description

Returns a dictionary of the related rendering properties.

• Parameters

None

Return

Dictionary<String, AxisConfig> - AxisConfig is an object that defines rendering properties

refreshChart()

Description

Refreshes the dataset for the specified subplot and dataset.

• Parameters

int subplotIndex

- int dataSetIndex
- Return

None

setDatasetEnabled()

Description

Sets a dataset to be enabled or not enabled.

• Parameters

string dataSetName

boolean isEnabled - A boolean representing if the dataset is enabled

Return

None

setDatasetPlotNumber()

Description

Sets a dataset's plot number.

- Parameters
 - string dataSetName
 - int plotNumber
- Return

None

setDatasetXAxis()

Description

Sets a dataset's X axis name.

• Parameters

string dataSetName

string axisName

Return

None

setDatasetYAxis()

Description

Sets a dataset's Y axis name.

• Parameters

string dataSetName

string axisName

Return

None

setSubplotMode()

Description

Sets the subplot mode to be used when there is more than one subplot.

• Parameters

int mode - The mode to set the chart to. The mode options are as follows:

- 0 Shared Domain1 Shared Range
- Return

setXAxes()

Description

Sets defined rendering properties using AxisConfig objects.

• Parameters

PyDictionary string keys to AxisConfig objects

Return

None

None

setYAxes()

Description

Sets defined rendering properties using AxisConfig objects.

• Parameters

PyDictionary string keys to AxisConfig objects

Return

None

Extension Functions

configureChart

Description

Provides an opportunity to perform further chart configuration via scripting.

• Parameters

Component self- A reference to the component that is invoking this function.

JFreeChart chart- A JFreeChart object. Refer to the JFreeChart documentation for API details.

Return

None

getXTraceLabel

Description

Provides an opportunity to configure the x-trace label. Return a string to override the default label.

Parameters

Component self- A reference to the component that is invoking this function.

JFreeChart chart - A JFreeChart object. Refer to the JFreeChart documentation for API details.

String penName - The name of the pen the x-trace label applies to.

int yValue - The y-value of the pen at the x-trace location

Return

None

Vision - Sparkline Chart

Component Palette Icon:

Sparkline Chart

On this page	
 Properties Scripting Component Functions Extension Functions Event Handlers Customizers Examples 	

The sparkline chart is a minimalistic chart component that displays a line-chart history for a single datapoint. Sparklines were invented by Edward Tufte as a way to show a great deal of contextual information in a very small amount of space. Sparklines are typically used to display the recent history (up to current time) of a datapoint so that the viewer can quickly discern the recent trend of a datapoint.

To use a sparkline, bind its Data property either to a Tag Historian realtime query, or to a database query. There should be two columns in this dataset: the first one a date column, the second a number. Each row will become a datapoint on the chart, and the dataset must be sorted by time in ascending order.

Instead of using axes to convey scale, the sparkline can display a band of color across the back of the chart which indicates the desired operating range of the datapoint. In this way, it is instantly obvious when a value is in its expected range, above that range, or below. The sparkline automatically configures its internal axes based on the data given to it. To give it a fixed range, fill in the Range High and Range Low properties.

Name	Description	Property Type	Scripting	Categor
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Border Inset	The amount of space to inset the chart inside its border.	double	.borderInset	Appearan
Chart Max	The value that corresponds to the upper edge of the chart. (Read only. Usable in bindings and scripting.)	Double	.chartMax	Uncategor ed
Chart Min	The value that corresponds to the lower edge of the chart. (Read only. Usable in bindings and scripting.)	Double	.chartMin	Uncategor ed
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Data	The history data to draw in the sparkline chart.	Dataset	.data	Data
Desired High	The high value of the desired operating range. If left blank (null), no desired range band will be shown.	Double	.desiredHi	Data
Desired Low	The low value of the desired operating range. If left blank (null), no desired range band will be shown.	Double	.desiredLo	Data
Desired Range Color	The color of the desired operating range band. Only used if the desired operating range is configured. See Color Selector.	Color	desiredRan geColor	Appearan

First Marker Color	The color of the first value marker. See Color Selector.	Color	firstMarkerC olor	Markers
First Marker Size	The size of the first value marker.	double	firstMarkerSi ze	Markers
First Marker Style	The style of the first value marker.	int	firstMarkerS tyle	Markers
First Value	The first (oldest) value in the dataset. (Read only. Usable in bindings and scripting.)	Double	.firstValue	Uncategor ed
High Marker Color	The color of the high value marker. See Color Selector.	Color	hiMarkerCol or	Markers
High Marker Size	The size of the high value marker.	double	hiMarkerSize	Markers
High Marker Style	The style of the high value marker.	int	hiMarkerStyle	Markers
Last Marker Color	The color of the last value marker. See Color Selector.	Color	lastMarkerC olor	Markers
Last Marker Size	The size of the last value marker.	double	lastMarkerSi ze	Markers
Last Marker Style	The style of the last value marker.	int	lastMarkerSt yle	Markers
Last Value	The last (most recent) value in the dataset. (Read only. Usable in bindings and scripting.)	Double	.lastValue	Uncategor ed
Line Color	The color of the sparkline. See Color Selector.	Color	.foreground	Appearan
Line Width	The width of the sparkline.	float	.lineWidth	Appearan
Low Marker Color	The color of the low value marker. See Color Selector.	Color	loMarkerCol or	Markers
Low Marker Size	The size of the low value marker.	double	IoMarkerSize	Markers
Low Marker Style	The style of the low value marker.	int	IoMarkerStyle	Markers
Max Value	The largest value in the dataset. (Read only. Usable in bindings and scripting.)	Double	.maxValue	Uncategor ed
Min Value	The smallest value in the dataset. (Read only. Usable in bindings and scripting.)	Double	.minValue	Uncategor ed
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Quality	The data quality code for any Tag bindings on this component.	int	.quality	Data
Range High	A fixed value for the upper edge of the chart. If left blank (null), the upper range will be calculated automatically.	Double	.rangeHi	Data
Range Low	A fixed value for the lower edge of the chart. If left blank (null), the lower range will be calculated automatically.	Double	.rangeLo	Data
Styles	Contains the component's styles.	Dataset	.styles	Appearan
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

间 Bar Chart

The Bar Chart represents numeric values in an underlying dataset. It is often configured to display as a category chart. A category chart is a chart whose X-values are categories (strings, names, groupings, etc) rather than numeric values (numbers, dates).

Like most chart components (other than the Easy Chart), the Data property drives the chart. The first column in the Data dataset defines the names of the categories. The rest of the columns define the values for each of the series (if there is more than one series per category), and thus should be numeric.

Note: If your data is 'turned on its side', meaning that the columns define the categories and rows define the series, then set the Extract Order to "By Column".

Note: You can bring up a context menu for this component when right-clicking on it either in the Designer's Preview Mode or in a Vision Client. See the Charting - Right Click Menu page for more details.

Name	Description	Property Type	Scripting	Categor
Bar Label Color	The color for the bar labels. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	barLabelCol or	Axes
Bar Label Font	The font for the bar labels.	Font	barLabelFont	Axes
Bar Label Offset	The offset between the bar and the bar label.	double	barLabelOff set	Axes

Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Categor y Axis Label	The label for the category axis.	String	categoryLab el	Axes
Categor y Axis Label Angle	The angle for the value axis' labels.	int	catAxisLabe IPosition	Axes
Categor y Axis Label Color	The color for the category axis label. See Color Selector.	Color	catAxisLabe IColor	Axes
Categor y Axis Label Font	The font for the category axis label.	Font	catAxisLabe IFont	Axes
Categor y Axis Lower Margin	The lower margin, as a percentage, of the category axis.	double	catAxisLowe rMargin	Axes
Categor y Axis Tick Color	The color for the category axis' ticks. See Color Selector.	Color	catAxisTick Color	Axes
Categor y Axis Tick Font	The font for the category axis' ticks.	Font	catAxisTick Font	Axes
Categor y Axis Upper Margin	The upper margin, as a percentage, of the category axis.	double	catAxisUppe rMargin	Axes
Categor y Margin	The margin between categories as a fraction of the total space.	double	categoryMar gin	Appearan
Chart Title	An optional title that will appear at the top of the chart.	String	.title	Appearan
Chart Type	Controls how the bar chart is displayed.	int	rendererType	Appearan
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Data	The data driving the chart.	Dataset	.data	Data
Extract Order	Controls whether the first row defines the categories or the series.	int	extractOrder	Data
Foregro und Transpar ency	The transparency of the bars (useful for 3D bars). Valid values are between 0 (0% opacity) and 1 (100% opacity).	float	foregroundA lpha	Appearan
Gradient bars?	If true, bars will be painted with a gradient 'shine'.	boolean	.gradient	Appearan
Item Margin	The margin between bars in a category as a fraction.	double	.itemMargin	Appearan
Labels?	Always display labels?	boolean	.labels	Appearan
Legend Font	The font for the legend items.	Font	.legendFont	Axes
Legend?	If true, show a legend for the chart.	boolean	legend	Appearan

Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Plot Backgro und	gro The background color for the plot. Co		plotBackgro und	Appearan
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Series Colors	The sequence of colors used for series in the bar chart. See Color Selector.	Color[]	seriesColors	Appearan
Shadow s?	If true, bars will have a drop-shadow beneath them.	boolean	.shadows	Appearan
Title Font	The font for the chart's title.	Font	.titleFont	Axes
Tooltips?	If true, show tooltips.	boolean	.tooltips	Behavior
Value Axis Auto- Range	If true, the value axis range will be determined automatically. If false, the specified upper and lower bounds will be used.	boolean	valAxisAuto Range	Axes
Value Axis Label	The label for the value axis	String	.valueLabel	Axes
Value Axis Label Color	The color for the value axis label. See Color Selector.	Color	valAxisLabel Color	Axes
Value Axis Label Font	The font for the value axis label.	Font	valAxisLabel Font	Axes
Value Axis Lower Bound	The lower bound of the value axis. Used only when auto-range is false.	double	valAxisLowe rBound	Axes
Value Axis Tick Color	The color for the value axis' ticks. See Color Selector.	Color	valAxisTick Color	Axes
Value Axis Tick Font	The font for the value axis' ticks.	Font	valAxisTickF ont	Axes
Value Axis Upper Bound	The upper bound of the value axis. Used only when auto-range is false.	double	valAxisUppe rBound	Axes
Value Axis Upper Margin	The upper margin, as a percentage, of the value axis. Only used when auto-range is true.	double	valAxisUppe rMargin	Axes
Vertical	Sets the orientation of the chart to vertical (true) or horizontal(false)	boolean	.vertical	Appearan
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

Vision - Bar Chart Scripting Functions

This page details the various component and extension functions available for Vision's Bar Chart component.

Component Functions

This component does not have component functions associated with it.

Extension Functions

configureChart

Description

Provides an opportunity to perform further chart configuration via scripting.

Parameters

Component self- A reference to the component that is invoking this function.

JFreeChart chart- A JFreeChart object. Refer to the JFreeChart documentation for API details.

- Return
- None

getBarColor

Description

Provides a chance to override the color of each bar. Can be used to have bar colors changed based upon bar value. Returning the value None will use the default bar color for the series.

• Parameters

Component self - A reference to the component that is invoking this function.

int series - The series index for this bar.

int category - The category index for this bar.

int value - The value (a number) of this bar.

Color defaultColor - The color that the bar would be if this function wasn't invoked.

Return

Color

- Extension Functions
- configureChart
- getBarColor

Vision - Radar Chart

On this page ...

Component Palette Icon:

🍪 Radar Chart

Radar charts, also known as web charts, spider charts, spider plots, and a few other names, display a dataset as a two dimensional polygon. The plot is arranged as a set of spokes with equal angles between them. Each spoke represents a value axis for the variable it corresponds to. Each dataset is then drawn as a connected polygon, where the points of the polygon are arranged on the spokes according to their value. Each row of the dataset has a minimum and maximum column -- these values are used to determine the scale of the spoke for that variable, with the midpoint representing the desired value.

The intended use of radar plots is to display realtime information in such a way that outliers can be quickly identified. This can be an efficient way to convey if a process is running on-spec or off-spec at a glance.

The radar chart gets its data from a dataset. Each row in the dataset will become a single variable (spoke) on the chart. The dataset must have a columns labeled "Value", "Min", and "Max"; other columns will be ignored. To display realtime data on a radar chart, you can use a cell-update binding to bind individual values to tag values. You can also drop tags onto a radar chart, with the EngMin binding to min and EngMax binding to max. If there are no existing cell-update bindings, the tags will replace existing data, otherwise the tags will be added to the end of the dataset. Alternatively, you can have realtime information stored by a transaction group to a database table, and drive the radar chart's dataset with a query binding.

Refer to Radar Chart to learn more.

Name	Description	Property Type	Scripting	Categor
Actual Fill Color	Fill color for the actual polygon. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	actualFillCol or	Appearan

Component Functions

This component does not have component functions associated with it.

Extension Functions

This component does not have extension functions associated with it.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

- Vision Component Customizers
- Style Customizer

Examples

Radar Charts display realtime information in such a way that outliers can be quickly identified. In this example, the Radar Chart plotted the values forming a polygon using the raw data in the code block below. You can quickly see where the process is out-of-spec and compare the values to where they should be.

Vision - Status Chart

On this page
Wide vs Tall DatasetsColor Mapping
Properties Scripting • Event Handlers
Customizers Examples

The Status Chart component allows you to visualize the status of one or more discrete datapoints over a time range. The X-axis is always a timeseries axis, and the Y-axis is a category axis, with one entry per data series. The chart is populated with a single dataset, the first column of which must be a datetime column.

Wide vs Tall Datasets

In Wide format, all of the columns but the first must be numeric. These "series" columns' headers will be used as the names on the y-axis. In Tall format, there should be exactly 3 columns. The first is the timestamp, the second is the series name, and the third is the value. For example:

Wide Format

t_stamp	Valve1	Valve2
2010-01-13 8:00:00	0	2
2010-01-13 8:02:00	0	2
2010-01-13 8:04:00	1	2
2010-01-13 8:06:00	1	1
2010-01-13 8:08:00	0	1

Tall Format

t_stamp	Name	Value
2010-01-13 8:00:00	Valve1	0
2010-01-13 8:00:00	Valve2	2
2010-01-13 8:02:00	Valve1	0
2010-01-13 8:02:00	Valve2	2
2010-01-13 8:04:00	Valve1	1
2010-01-13 8:04:00	Valve2	2
2010-01-13 8:06:00	Valve1	1
2010-01-13 8:06:00	Valve2	1
2010-01-13 8:08:00	Valve1	0
2010-01-13 8:08:00	Valve2	1

Color Mapping

Apart from getting the data into the series chart, the only other commonly configured option is the mapping of discrete values to colors. This is done in the Status Chart Customizer. Each named series can have its own mapping of colors, if desired. These mappings are stored in the expert-level dataset property Series Properties Data so they can be altered at runtime.

Name	Description	Property Type	Scripting	Categor
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.

Deprecate	ed Properties		-	-
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

See the Vision - Status Chart Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

The Status Chart component has its own customizer, used to set a number-to-color mapping for each series in the Series Data property.

Status Chart Customizer - Property Description

Property	Description
Series	 Selectable list of all objects in the Series Data property. Wide format: Each non-timestamp column. Tall format: each unique value in the Name column.
Properties Table	The number-to-color mapping for the selected Series.
Value	A numeric value to match against.
Color	The color to display for the given value.
Apply To All	Set all of the Series mappings to the currently selected mapping.

Examples

This example uses the Status Chart to display the state of each of the three machines over consecutive days using the Muli-State button. Tag History was turned on to record history HOA values. The Series Data property's dataset populates the Status Chart using a Tag History Binding. Yo

u can view the raw data by clicking on the Dataset Viewer icon to the right of the Series Data property. Each color represents a state for the machine and can be set in the Series Properties Data property. This example also has the raw data in the code block in case you want to try it for yourself.

Vision - Status Chart Scripting Functions

This page details the various component and extension functions available for Vision's Status Chart component.

Component Functions

This component does not have component functions associated with it.

Extension Functions

configureChart

Description

Provides an opportunity to perform further chart configuration via scripting.

Parameters

Component self- A reference to the component that is invoking this function.

JFreeChart chart- A JFreeChart object. Refer to the JFreeChart documentation for API details.

Return

None

getToolTip

Description

Return a formatted tool tip String

Parameters

Component self- A reference to the component that is invoking this function.

int seriesIndex-The series index corresponding to the column in the series dataset.

int selectedTimeStamp-The time stamp corresponding to the x value of the displayed tooltip. The time stamp is the number of seconds since the epoch.

int timeDiff-The width of the current status interval measured in seconds since the epoch.

int seletedStatus-The status value corresponding to the x value of the displayed tooltip.

PyDataset data-The series dataset as a PyDataset.

PyDataset properties-The series properties dataset as a PyDataset.

string defaultString-The default tooltip string.

Return

String defaultString

Component Palette Icon:

The Pie Chart component displays a familiar-looking pie chart. A Pie Chart displays a list of named items, each of which has a value that is part of a total. The total is the sum of the value of each item. The key to the Pie Chart component is the Data property, which contains the items that will be displayed as pie wedges. Typically, this dataset will be bound to a SQL Query Binding in Vision to pull dynamic data out of an external database.

Bananas	56				
Kiwis	19				

Similar to other charts, the pie chart can actually accept data in two formats. You can tell the pie chart which format to use via its Extract Order proper ty. The two extract orders are By Column or By Row. The following table shows the two styles for the data that created the pie chart in the screenshot.

Labels

In addition to the color-coded legend, the pie chart can annotate each wedge with a label. The format of the label is controlled via the Label Format pr operty.

For example, the format string used in the screenshot is " {0} = {2} ({3}) " This is a pattern string that uses the following placeholders:

- {0} the item label
- {1} the item value
- {2} the item percentage

Note: You can bring up a context menu for this component when right-clicking on it either in the Designer or in a Vision Client. See the Charting -Right Click Menu page for more details.

Name	Description	Property Type	Scripting	Categor
3D Depth Factor	The depth of a 3D pie as a factor of the chart height.	double	.depthFactor	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Chart Title	An optional title that will appear at the top of the chart.	String	.title	Appearan
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Data	The data driving the chart.	Dataset	.data	Data
Enforce Circularit y?	If true, the pie cannot be an oval, even if the overall chart is.	boolean	.circular	Appearan
Extract Order	Controls whether or not a pie plot views columns as pies, or rows.	int	extractOrder	Data
Foregro und Transpar ency	The transparency of the pie (useful for 3D pies). Valid values are between 0 (0% opacity) and 1 (100% opacity).	double	foregroundA Ipha	Appearan
Label Font	The font for labels items, if there are labels.	Font	.labelFont	Appearan
Label Format	Formatting String. '{0}' is the wedge name, '{1}' is the value, '{2}' is the percent.	String	.labelFormat	Appearan
Labels?	Should labels be displayed near sections?	boolean	.labels	Appearan
Legend Font	The font for legend items, if there is a legend.	Font	.legendFont	Appearan
Legend?	Should there be an item legend below the chart?	boolean	.legend	Appearan
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Outline Colors	The colors to use for the pie wedge outlines. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color[]	outlineColors	Appearan
Outline Visible	Whether to display an outline around the pie chart.	boolean	outlineVisible	Appearan
Outline Stroke	The width for the section outline stroke.	float	outlineStroke	Appearan
Plot Backgro und	The background color for all plots, unless they override it. See Color Selector.	Color	plotBackgro und	Appearan
Plot Insets	The padding to use around the actual plot rendering area.	int	.plotInsets	Appearan
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Rotation	Draw the wedges clockwise or counter-clockwise from the starting angle?	int	.rotation	Appearan
Section Colors	The colors to use for the pie wedge fills. See Color Selector.	Color[]	sectionColors	Appearan
Selected Wedge	The currently selected wedge. (Read only. Usable in bindings and scripting.)	String	selectedData	Uncategor ed

Selectio n Enabled?	If true, the user will be able to select wedges on the chart. The selected wedge will be highlighted, and the "selectedData" property will reflect it.	boolean	selectionEn abled	Behavior
Selectio n Highlight Color	The color of the selection highlight. See Color Selector.	Color	selectionHig hlightColor	Appearan
Selectio n Highlight Width	The line width of the selection highlight.	float	selectionHig hlightWidth	Appearan
Starting Angle	The start angle to draw the pie wedges.	int	.startAngle	Appearan
Style	Style of pie chart, standard, 3D, or ring.	int	.style	Appearan
Title Font	The font for the chart's title.	Font	.titleFont	Appearan
Tooltip Format	Formatting String. '{0}' is the wedge name, '{1}' is the value, '{2}' is the percent.	String	tooltipFormat	Appearan
Tooltips?	Should tooltips be displayed when the mouse hovers over sections?	boolean	.tooltips	Behavior
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	ed Properties	-	-	-
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

See the Vision - Pie Chart Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

• Vision Component Customizers

Examples

Code Snippet #The following code will print named and value of the selected wedge to the console. #Alternatively, this can be used to write to a custom property of a table that is used to create the 'Where' clause of a SQL query that populates a table. selectedWedge = event.source.selectedData print selectedWedge

Vision - Pie Chart Scripting Functions

This page details the various component and extension functions available for Vision's Pie Chart component.

Component Functions

This component does not have component functions associated with it.

Extension Functions

configureChart

Description

Provides an opportunity to perform further chart configuration via scripting.

Parameters

Component self- A reference to the component that is invoking this function.

JFreeChart chart- A JFreeChart object. Refer to the JFreeChart documentation for API details.

Return

None

On this page ...

Vision - Box and Whisker Chart

On this page
 Properties Scripting Component Functions Extension Functions Event Handlers Customizers Examples

Component Palette Icon:

A Box and Whisker chart displays pertinent statistical information about sets of data. Each box represents a set of numbers. The upper and lower bounds of the box represent the 1st and 3rd quartiles. The line inside the box represents the median. The extends of the "whiskers" represent the max and min outliers. For a more detailed description, see http://mathworld.wolfram.com/Box-and-WhiskerPlot.html.

The configuration for setting up a box and whisker chart, like most charts, is populating the Data property. The dataset for a box and whisker chart contains sets of numbers. Each column defines a series of values, for which a "box" will be calculated. The column headers define the name for the box. You may also have an optional first column that is a String column, which can break up the series into categories.

To learn more, refer to Box and Whisker Chart.

Note: You can bring up a context menu for this component when right-clicking on it either in the Designer or in a Vision Client. See the Charting -Right Click Menu page for more details.

Name	Description	Property Type	Scripting	Categor
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Categor y Axis Title	A text label to display on the category axis.	String	categoryAxi sTitle	Appearan
Chart Title	An optional title that will appear at the top of the chart.	String	.title	Appearan
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common

Data	The data driving the chart	Dataset	data	Data
Data		Dataset	.uaia	Data
Fill Boxes?	Fill the boxes with their color?	boolean	.fillBoxes	Appearan
Font	Font of text on this component.	Font	.font	Appearan
Legend?	Show a legend on the chart?	boolean	.legend	Appearan
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Plot Backgro und	The background color for the plot. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	plotBackgro und	Appearan
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Series Colors	The colors to paint each box in a series. See Color Selector.	Color[]	seriesColors	Appearan
Tooltips?	Show tooltips on tasks?	boolean	.tooltips	Behavior
Value Axis Title	A text label to display on the value axis. String . value.		valueAxisTitle	Appearan
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

Component Functions

This component does not have component functions associated with it.

Extension Functions

This component does not have extension functions associated with it.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

This component does not have any custom properties.

Examples

This example uses the Box & Whisker Chart to display information about two sets of data, Bin A and Bin B, and both contain Diamonds and Rubies. The Box and Whisker Chart is displaying a large amount of data as you can tell from looking at the code block below. It displays high, low, and median values which is where 50% of the data falls. The dataset contains all the raw data and calculates the upper and lower bounds of each box which are the solid colored boxes, horizontal line inside the box which represents the median value, and the whiskers which represent the minimum and maximum values which are outside the solid color boxes.

The dataset populates the chart. You can view the data in the dataset by clicking on the dataset icon. This example also has the raw data in the code block in case you want to try it for yourself.

🔄 Equipment Schedule

The Equipment Schedule view is a mix between the status chart, gantt chart, and a calendar view. It conveys a lot of information about equipment, including current status, production schedule, production status, scheduled and unexpected downtime.

The equipment schedule is powered by four datasets. Information is retrieved from the datasets by column name, case-insensitive. The order of the columns is not important. Optional columns may be omitted.

The "Items" Dataset

Name	Туре	Optional	Description
ID	Any	N	The identifier for this item. May be any type, will referenced by each entry in the Scheduled Events dataset.
Label	String	N	The text to display in the header.
Foreground	Color	Y	Text color.
Background	Color	Y	Background color.
StatusImagePath	String	Y	A path to an image to display to the right of the header label.

Describes the "items" or "cells" to display schedules for. Each entry in this dataset will become a row of the chart.

The "Scheduled Items" Dataset

Lists the scheduled events for each item described in the "Items" dataset. Each scheduled event can have a colored lead, or change-over time, a label, a background color, and a progress.

Name	Туре	Optional	Description
EventId	String	Y	An identifier for the event, used for event selection.
ItemId	Any	N	The ID of the item to correlate this event with. If no such item is found, the event won't be shown.
Label	String	N	The text ot display in the event's box.
StartDate	Date	N	The start-time for the event.
EndDate	Date	N	The end-time for the event.
Foreground	Color	Y	The text color of the event.
Background	Color	Y	The background color of the event.
LeadTime	Integer	Y	Time, in seconds, to display as lead time.
LeadColor	Color	Y	The color for the lead time, if any.
PctDone	Number	Y	A value from 0 to 100 to be displayed as a progress bar, use -1 to hide progress bar.

The "Downtime" Dataset

Entries in this dataset will be displayed as simple colored overlays on top of the events, correlated against an item defined in the "Items" dataset.

Name

ItemId
StartDate
EndDate
Color
Layer

The "Breaks" Dataset

Entries in this dataset will be displayed as colored underlays beneath all events.

Name	Туре	Optional	Description
StartDate	Date	Ν	The start-time for the break event.
EndDate	Date	Ν	The end-time for the break event.
Color	Color	Y	The color to use.

Name	Description	Property Type	Scripting	Categor
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Break Events	Scheduled breaks, which will appear as downtime for all items.	Dataset	breakEvents	Data
Current Time Color	The color of the current time indicator. Can be chosen from color wheel, chosen from color palette, or entered as R GB or HSL value. See Color Selector.	Color	.nowColor	Appearan
Downtim e Events	Downtime events correlated to a specific item.	Dataset	downtimeEv ents	Data
Drag Enabled	Controls whether or not scheduled events can be dragged for rescheduling.	boolean	dragEnabled	Behavior
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common
End Date	The end of the time range to display.	Date	.endDate	Data
Event Border	The normal border for a scheduled event.	Border	eventBorder	Appearan
Event Font	The font to use for the event labels.	Font	.eventFont	Appearan
Event Margin	The margin to leave visible above and below a scheduled event.	int	scheduledE ventMargin	Appearan
Header Backgro und	The color of the background for the header timeline. See Color Selector.	Color	headerBack ground	Appearan
Header Font	The font of the text in the header timeline.	Font	.headerFont	Appearan

Header Item Font	The font to use for the header items' labels.	Font	.itemFont	Appearan
Header Text Color	The color of the text in the header timeline. See Color Selector.	Color	headerText Color	Appearan
Items	The cells, or equipment items, to have their schedules displayed.	Dataset	.items	Data
Line Color	The color of separating lines in the schedule.	Color	.lineColor	Appearan
Name	The name of this component.	String	.name	Common
Progress Bar Backgro und	The background color for the event progress bars. See Color Selector.	Color	progressBac kground	Appearan
Progress Bar Border	The border color for the event progress bars. See Color Selector.	Color	progressBor der	Appearan
Progress Bar Fill	The color for 'done' portion the event progress bars. See Color Selector.	Color	.progressFill	Appearan
Resize Enabled	Controls whether or not scheduled events resized for duration changes.	boolean	resizeEnabl ed	Behavior
Row Height	The height of each event's schedule row.	int	.lineHeight	Appearan
Schedul e Backgro und	The background color of the schedule area. See Color Selector.	Color	scheduleBa ckground	Appearan
Schedul ed Events	The scheduled events for all configured items.	Dataset	scheduledE vents	Data
Selected Event Border	The border for a selected scheduled event.	Border	selectedEve ntBorder	Appearan
Selected Event ID	The ID of the selected event.	String	selectedEve nt	Data
Start Date	The beginning of the time range to display.	Date	.startDate	Data
Visible	If disabled, the component will be hidden.	boolean	.visible	Common

See the Vision - Equipment Schedule Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

• Vision Component Customizers

Examples

The Equipment Schedule contains a lot information about Machines 1-4 from May 18 through May 20 such as equipment status, the production schedule, production status, and schedule and unscheduled downtime. It provides a view into the status of equipment on the production floor in realtime and scheduled work planned for three days. It uses four datasets: Items, Scheduled Events, Downtime Events, and Break Events. Each dataset is shown below with it's associated raw data.

You'll notice each piece of equipment has a lead time or change-over time, a unique Order number for the run, background color and displays a progress bar. Equipment downtime entries are displayed as colored overlays on top of the events. Break events with a start and end time are displayed as colored underlays beneath the events.

onPopupTrigger

.getDateAt(event)Extension FunctionsonBackgroundDragged

This page details the various component and extension functions available for Vision's Equipment Schedule component.

Component Functions

.getDateAt(event)

The following feature is new in Ignition version **8.1.10** Click here to check out the other new features

Description

Returns a date time representing a point in time at the mouse event position.

Parameters

Event Object - A mouse event object.

Return

Date - A datetime, representing a point in time on the chart where the mouse event occurred.

Extension Functions

onBackgroundDragged

Description

Called when the user drags a segment on the schedule background.

Parameters

Component self - A reference to the component that is invoking this function.

int itemID - The ID of the equipment item of the row where the user dragged.

Date startDate - The datetime corresponding to where the user started dragging.

Date endDate - The datetime corresponding to where the user ended dragging.

Event Object event - The mouse event.

Return

None

onEventClicked

Description

Called when the user clicks on a scheduled event. Use event.clickCount to detect double clicks.

Parameters

Component self - A reference to the component that is invoking this function.

int itemID - The ID of the equipment item of the event that was clicked on.

int eventId - The ID of the event that was clicked on.

Event Object event - The mouse event.

Return

None

onEventDropped

Description

Called when the user drags and drops a scheduled event. It is up to this script to actually alter the underlying data to reflect the schedule change.

• Parameters

Component self - A reference to the component that is invoking this function.

int eventId - The ID of the scheduled event that was moved.

int oldItemId - The ID of the item this event was originally correlated against.

int newltemld - The ID of the item whose schedule the event was dropped on.

Date oldStartDate - The original starting datetime of the event.

Date newStartDate - The new starting datetime of the event.

Date newEndDate - The new ending datetime of the event.

Return

None

onEventPopupTrigger

Description

Called when the user right-clicks on a scheduled event. This would be the appropriate time to create and display a popup menu.

• Parameters

Component self - A reference to the component that is invoking this function.

int itemId - The ID of the equipment item of the event that was right-clicked on.

int eventId - The ID of the event that was right-clicked on.

Event Object event - The mouse event that caused the popup trigger.

Return

None

onEventResized

Description

Called when the user drags the edge of an event to resize its time span. It is up to this script to actually alter the underlying data to reflect the schedule change.

• Parameters

Component self - A reference to the component that is invoking this function.

int eventId - The ID of the scheduled event that was resized.

int itemId - The ID of the item this event is correlated against.

Date oldStartDate - The original starting datetime of the event.

Date oldEndData - The original ending datetime of the event.

Date newStartDate - The new starting datetime of the event.

Date newEndDate - The new ending datetime of the event.

Return

None

onPopupTrigger

Description

Called when the user right-clicks outside of an event. This would be the appropriate time to create and display a popup menu.

• Parameters

Component self - A reference to the component that is invoking this function.

int itemId - The item ID of the equipment line that was clicked on (if any).

Event Object event - The mouse event that caused the popup trigger.

Return

None

Vision - Gantt Chart

On this page
 Properties Scripting Event Handlers Customizers Examples

A Gantt chart is used for task scheduling. It shows a list of named tasks, each of which have a start date, and date, and a percentage complete. This allows an easy way to visualize tasks, workflows, and scheduling.

The Gantt chart is configured by populating its Data property. Each row of the dataset represents a task. There should be four columns: the task label, the start date, the end date, and the percentage (0-100) complete.

Note: You can bring up a context menu for this component when right-clicking on it either in the Designer or in a Vision Client. See the Charting - Right Click Menu page for more details.

Name	Description	Property Type	Scripting	Categor
Axis Font	The font for axis labels.	Font	axisLabelFo nt	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Chart Title	An optional title that will appear at the top of the chart.	String	.title	Appearan
Complet e Color	The color to draw the amount completed in. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	completeCol or	Appearan
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Data	The data driving the chart.	Dataset	.data	Data
Date Axis Title	A date label to display on the axis title.	String	dateAxisTitle	Appearan
Incompl ete Color	The color to draw the amount remaining to do in. See Color Selector.	Color	incompleteC olor	Appearan
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common

Name	The name of this component.	String	.name	Common
Plot Backgro und	The background color for the plot. See Color Selector.	Color	plotBackgro und	Appearan
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Task Axis Title	A task label to display on the Axis Title.	String	taskAxisTitle	Appearan
Task Color	The main color to draw tasks. See Color Selector.	Color	.taskColor	Appearan
Tick Font	The font for tick labels.	Font	axisTickLab elFont	Appearan
Title Font	The font for the optional chart title.	Font	.titleFont	Appearan
Tooltips?	Show tooltips on tasks?	boolean	.tooltips	Behavior
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

See the Vision - Gantt Chart Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

- Vision Component Customizers
- Style Customizer

Examples

This example shows the tasks associated with a construction project on a new house. It is configured by populating the Data Property. Each row of the dataset includes the start date, end date and a percentage complete for each task. It is a good tool for task scheduling and a easy way to visualize tasks, workflow and scheduling.

Gantt Chart - Dataset Editor

Vision - Gantt Chart Scripting Functions

This page details the various component and extension functions for Vision's Gantt Chart component.

Component Functions

This component does not have component functions associated with it.

Extension Functions

configureChart

Description

Provides an opportunity to perform further chart configuration via scripting.

• Parameters

Component self- A reference to the component that is invoking this function.

JFreeChart chart- A JFreeChart object. Refer to the JFreeChart documentation for API details.

Return

None

On this page ...

Component Palette Icon:

Calendar

Displays a calendar and time input directly embedded in your window. Most commonly used by including one of the two date properties (immediate or latched) from the calendar in dynamic SQL Query Binding in Vision.

Name	Description	Property Type	Scripting	Categor
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.		.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Date (immedi ate)	The date as it is selected right now.	Date	.date	Data
Date (latched)	The date the last time "OK" was pressed.	Date	.latchedDate	Data
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component. See Color Selector.	Color	.foreground	Appearan
Format String	The date formatting pattern used to format the string versions of the dates.	String	.format	Behavior

Formatte d Date	The date property, as formatted by the format string.	String	formattedDa te	Data
Formatte d Latched Date	The latched date property, as formatted by the format string.	String	formattedLa tchedDate	Data
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Opaque	If false, backgrounds are not drawn. If true, backgrounds are drawn.	boolean	.opaque	Common
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Selected Border	The border for the selected day indicator.	Border	selectedBor der	Appearan
Show OK Button	Turn this off if you don't want to show the OK button. The latched date and the immediate date will be equivalent.	boolean	showOkButt on	Behavior
Show Time	Turn this off if you don't want to show the time panel.	boolean	.showTime	Behavior
Styles	Contains the component's styles.	Dataset	.styles	Appearan
Time Display Format	The format for displaying time in the panel.	int	timeDisplay Format	Behavior
Time Style	Select how this calendar should treat the time portion of the date.	int	.timeStyle	Behavior
Title Backgro und	The background of the title bar. See Color Selector.	Color	titleBackgro und	Appearan
Today Backgro und	Background color for the today indicator. See Color Selector.	Color	todayBackgr ound	Appearan
Today Foregro und	Foreground color for the today indicator. See Color Selector.	Color	todayForegr ound	Appearan
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Weeken d Backgro und	Background color for the weekend indicators. See Color Selector.	Color	weekendBa ckground	Appearan
Weeken d Foregro und	Foreground color for the weekend indicators. See Color Selector.	Color	weekendFor eground	Appearan
Deprecate	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

Component Functions

This component does not have component functions associated with it.

Extension Functions

This component does not have extension functions associated with it.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Extension Functions

This component does not have extension functions associated with it.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

- Vision Component Customizers
- Style Customizer

Examples

There are no examples associated with this component.

Vision - Date Range

The date range component provides an intuitive, drag-and-drop way to select a contiguous range of time. The user is shown a timeline and can drag or stretch the selection box around on the timeline. The selected range is always a whole number of units, where the unit is determined by the current zoom level.

Note: The Start/End dates and Outer Start/End dates will be ignored when the window opens unless the Startup Mode property is set to "None."

Data Density Histogram

Date Range

12

As an advanced optional feature, the date range can display a data density histogram inside the timeline. This is useful for historical data with gaps in it, so that the end user isn't hunting for data. (Tip: This is also great for demos, to make it easy to find historical data in a database that isn't being continuously updated).

To use this feature, bind the Data Density dataset to a query that returns just the timestamps of the target table. These timestamps will be used to fill in the histogram behind the timeline. You can use the Outer Range Start Date and Outer Range End Date properties in your query to limit the overall return size for the query.

Note: Timestamps must be ordered by date (ascending) to display correctly.

Name	Description	Property Type	Scripting	Categor
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Box Fill	The fill color for the selection box.	Color	.boxFill	Appearan
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	int	.cursorCode	Common
Data Density	A dataset that is used to calculate a histogram of data density.	Dataset	.densityData	Data
Date Style	The style to display dates in. For international support.	int	.dateStyle	Appearan
Editor Backgro und	The background color of the textual date range editor portion of this component.	Color	editorBackgr ound	Appearan
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common

End Date	The ending date of the currently selected range.	Date	.endDate	Data
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component.	Color	.foreground	Appearan
High Density Color	The color used to indicate high data density. See Color Selector.	Color	highDensity Color	Appearan
Max Selection	The maximum size of the selected date range.	String	maxSelectio nSize	Behavior
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Opaque	If false, backgrounds are not drawn. If true, backgrounds are drawn.	boolean	.opaque	Common
Outer Range End	The ending date of the available outer range.	Date	outerRange EndDate	Data
Outer Range Start	The starting date of the available outer range.	Date	outerRange StartDate	Data
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Selectio n Highlight	The focus highlight color for the selection box. See Color Selector.	Color	selectionHig hlight	Appearan
Start Date	The starting date of the currently selected range.	Date	.startDate	Data
Startup Mode	Controls whether or not this date range automatically assigns itself a starting range based on the current time	int	startupMode	Behavior
Startup Range	If startup mode is Automatic, this will be the starting range of time available for selection.	String	startupRange	Behavior
Startup Selection	If startup mode is Automatic, this will be the starting selected range.	String	startupSelec tion	Behavior
Styles	Contains the component's styles.	Dataset	.styles	Appearan
Tick Density	This is multiplied by the width to determine the current ideal tick unit.	float	.tickDensity	Behavior
Time Style	The style to display times of day. For international support.	int	.timeStyle	Appearan
Today Color	The color of the "Today Arrow" indicator. See Color Selector.	Color	todayIndicat orColor	Appearan
Track Margin	The amount of room on either side of the slider track. May need adjusting of default font is changed.	int	.trackMargin	Appearan
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Deprecate	ed Properties			
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate

See the Vision - Date Range Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

• Vision Component Customizers

Style Customizer

Examples

Code Snippet //A Query binding on another component on the same window might look like this: SELECT Column1, Column2, Column3 FROM MyTable WHERE t_stamp >= "{Root Container.Date Range.startDate}" AND t_stamp <= "{Root Container.Date Range.endDate}"

Vision - Date Range Scripting Functions

This page details the various component and extension functions for Vision's Date Range component.

Component Functions

.setRange(start, end)

Description

Sets the selected range. The outer range will move if needed. Note: The start and end times are determined based on the zoom level and may not move (or may move farther than intended) if the component is zoomed out too far for the amount of change attempted. For example, when days are showing, moving the start time 5 minutes forward will not effect the start, and moving the end time 5 minutes forward will add one day.

Parameters

Date start - The starting date for the new selection.

Date end - The ending date for the new selection.

Return

None

Code Snippet

```
# This example moves the existing Start Date and End Date
# of a Date Range component ahead 8 hours
from java.util import Calendar
# Get the current start and end
dateRangeComponent = event.source.parent.getComponent('Date Range')
startDate = dateRangeComponent.startDate
endDate = dateRangeComponent.endDate
# Calculate the new start and end dates
cal = Calendar.getInstance();
cal.setTime(startDate);
cal.add(Calendar.HOUR, -8);
newStart = cal.getTime();
cal.setTime(endDate);
cal.add(Calendar.HOUR, -8);
newEnd = cal.getTime();
# Set the new range for the component. The outer range will
# automatically expand if needed.
dateRangeComponent.setRange(newStart, newEnd)
```

.setOuterRange(start, end)

Description

Sets the outer range. The selected range will move if needed. Note: The start and end times are determined based on the zoom level and may not move (or may move farther than intended) if the component is zoomed out too far for the amount of change attempted. For example, when days are showing, moving the start time 5 minutes forward will not effect the start, and moving the end time 5 minutes forward will add one day.

Parameters

Date start - The starting date for the new outer range.

Date end - The ending date for the new outer range.

Return

On this page ...

- Component Functions
 - .setRange(start, end).setOuterRange(start, end)
- Extension Functions

None

```
Code Snippet
# This example moves the existing Outer Date Range
# of a Date Range component back two days
from java.util import Calendar
# Get the current start and end of the outer range
dateRangeComponent = event.source.parent.getComponent('Date Range')
startDate = dateRangeComponent.outerRangeStartDate
endDate = dateRangeComponent.outerRangeEndDate
# Calculate the new start and end dates for the outer range
cal = Calendar.getInstance();
cal.setTime(startDate);
cal.add(Calendar.DAY_OF_MONTH, 2);
newStart = cal.getTime();
cal.setTime(endDate);
cal.add(Calendar.DAY_OF_MONTH, 2);
newEnd = cal.getTime();
\ensuremath{\texttt{\#}} Set the new outer range for the component.
dateRangeComponent.setOuterRange(newStart, newEnd)
```

Component Palette Icon:

The User Management component provides a built-in way to edit User Source users and roles from a Vision Client. To make changes to the Gateway's system user source from the Designer or Client, the Allow User Admin setting must be enabled. This allows for the administration of the Gateway's system user source from the Designer and Vision Client. Unless this is enabled, the Vision Module's User Management component is prevented from modifying the Gateway system's selected user source and you will see an error at the bottom of the component if it is attempted.

This feature was changed in Ignition version 8.1.25:

If a User Source has its Schedule Restricted option enabled, modifications made using the Vision User Management component used to be ignored. S chedule modifications are now applied on top of the user's defined schedule to determine their effective schedule when evaluating for Schedule Restricted login.

This component can be run in one of three modes:

Manage Users: In this mode, the component manages all of the users contained in the user source. Users and roles may be added, removed, and edited.

Edit Single: In this mode, the component only edits a single user. Which user is being edited is controlled via the "User Source" and "Username" properties.

Edit Current: In this mode, the user who is currently logged into the project can edit themselves. The ability to assign roles is not available in this mode. This can be useful to allow users to alter their own password, adjust their contact information, and update their schedules.

Marning: Be careful to only expose this component to users who should have the privileges to alter other users. Access to this component in **Manage Users** mode will allow users to edit other users' passwords and roles.

This feature was changed in Ignition version 8.1.18:

The User Management component cannot be used in **Edit Current** mode when the Vision Client is using an Identity Provider to log in. Attempting to use the User Management component in this situation will result in the Vision client throwing an error and a warning:

Vision - User Management Scripting Functions

This page details the various component and extension functions available for Vision's User Management component.

Component Functions

This component does not have any component functions associated with it.

Extension Functions

filterUser

Description

Called for each user loaded into the management table. Return false to hide this user from the management table. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

User Object user - The user object itself. Call user.get('propertyName') to inpsect. Common properties: 'username',' schedule', 'language', user.getRoles() for a list of rolenames.

Return

Boolean

filterRole

Description

Called for each role loaded into the management table. Return false to hide this role from the management table. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

String role - The role name.

Return

Boolean

filterSchedule

Description

Called for each schedule loaded into the schedule dropdown in the edit user panel. Return false to hide this schedule from the dropdown. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

String schedule - The schedule name.

Return

Boolean

onCreateUser

Description

On this page ... Component Functions •

- **Extension Functions**
 - filterUser
 - filterRole
 - filterSchedule
 - onCreateUser
 - onDeleteUser ٠
 - onSaveUser
 - ٠ onCreateRole
- onDeleteRole
- onSaveRole

Called when the add button is pressed in the users table

• Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the add by calling saveContext.rejectSave('reason')

Return

None

onDeleteUser

Description

Called when the delete button is pressed in the users table. This code is executed in the background thread and is called once for each user selected.

• Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the edit by calling saveContext.rejectSave('reason'). If more than one user is rejected, reasons will be concatenated.

Object user - The user that is trying to be deleted. Call user.get('propertyName') to inspect. Common properties: 'username', 'schedule', 'language'. Call user.getRoles() for a list of rolenames.

Return

None

onSaveUser

Description

Called when the save button is pressed when adding or editing a user. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the edit by calling saveContext.rejectSave('reason').

User Object user - The user that is trying to be saved. Call user.get('propertyName') to inspect. Common properties: 'username', 'schedule', 'language'. Call user.getRoles() for a list of rolenames.

Return

None

onCreateRole

Description

Called when the add button is pressed in the roles table.

Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the add by calling saveContext.rejectSave('reason')

Return

None

onDeleteRole

Description

Called when the save button is pressed when adding or editing a role. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the edit by calling saveContext.rejectSave('reason'). If more than one role is rejected, reasons will be concatenated.

String name - The role name that is being deleted.

Return

None

onSaveRole

Description

Called when the save button is pressed when adding or editing a role. This code is executed in a background thread.

• Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the edit by calling saveContect.rejectSave('reason').

String oldName - The role name before editing. Will be None for a role being added.

String newName - The new name of the edited role.

Return

None

Vision - Schedule Management

Indiffe	Description

lidays	

On this page	
 Properties Scripting Event Handlers Customizers Example 	

Component Palette Icon:

Schedule Management

Note: Making changes to users from a client with this component requires that the **User Management** permissions has been enabled for the project.

This component allows for management of schedules. Schedules can be defined by specifying which days of the week and which times of day they are active on. The times of day are defined using a string of time ranges, where the times are specified in 24-hr format with dashes between the beginning and the end. Multiple ranges can be specified by separating them with commas. Examples:

8:00-17:00	Valid from 8am to 5pm
6:00-12:00, 12:45-14:00	Valid from 6am to noon, and then again from 12:45pm to 2pm
0:00-24:00	Always valid.

Schedules that alternate weekly or daily can be specified by using the repetition settings. All repeating schedules need a starting day. For example, you could have a schedule that repeats on a weekly basis, with 1-week on and 1-week off. This schedule would be active for seven days starting on the starting day, and then inactive for the next seven days, then active for seven days, and so on. Note that the days of the week and time settings are evaluated in addition to the repetition settings. This means that both settings must be true for the schedule to be active. Also note that if you set "Repe at / Alternate" to a setting other than "Off" and you do not specify a starting day, the schedule will never be active. See Color Selector.

Vision - Schedule Management Scripting Functions

This page details the various component and extension functions available for Vision's Schedule Management component.

Component Functions

This component does not have component functions associated with it.

Extension Functions

filterSchedule

Description

Called for each schedule loaded into the management table. Return false to hide this schedule from the management table. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

String schedule - The schedule name

Return

Boolean

filterHoliday

Description

Called for each holiday loaded into the management table. Return false to hide this holiday from the management table. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

String holiday - The holiday name.

Return

Boolean

onCreateSchedule

Description

Called when the add button is pressed when adding a schedule. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the add by calling saveContect.rejectSave('reason').

Return

None

onDeleteSchedule

Description

Called when the delete button is pressed for one or more schedules. This code is executed in a background thread, once for each schedule to be deleted.

On this page ...

Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the deletion by calling saveContect.rejectSave('reason').

String name - The name of the schedule to be deleted.

Return

None

onSaveSchedule

Description

Called when the save button is pressed when adding or editing a schedule. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the edit by calling saveContect.rejectSave('reason').

String oldName - The schedule name before editing. Will be None for a schedule being added.

String newName - The new name of the edited schedule.

Return

None

onCreateHoliday

Description

Called when the add button is pressed when to add a holiday. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the add by calling saveContect.rejectSave('reason').

Return

None

onDeleteHoliday

Description

Called when the delete button is pressed for one or more holidays. This code is executed in a background thread, once for each holiday to be deleted.

• Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the edit by calling saveContect.rejectSave('reason').

String name - The name of the holiday to be deleted.

Return

None

onSaveHoliday

Description

Called when the save button is pressed when adding or editing a holiday. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the edit be calling saveContext.rejectSave('reason')

String oldName - The holiday name before editing. Will be None for a holiday being added.

String newName - The new name of the edited holiday.

Return

None

Extension Functions

filterRoster

Description

Called for each roster loaded into the management table. Return false to hide this roster from the management table. This code is executed in a background thread.

Parameters

Component self- A reference to the component that is invoking this function.

String roster - The name of the roster.

Return

Boolean

filterAvailableUser

Description

Called for each user in a user source to be shown as an available user for the roster currently being edited. Return false to hide this user so that it cannot be added to the roster. This code is executed in a background thread.

Parameters

Component self- A reference to the component that is invoking this function.

String roster - The name of the roster being edited.

String userSource - The name of the user source being used to populate the list of available users.

User Object user - The user object itself. Call user.get('propertyName') to inspect. Common properties: 'username','schedule','language'. Call user.getRoles() for a list of rolenames.

Return

Boolean

onSaveRoster

Description

Called when the save button is pressed when editing a roster. This code is executed in a background thread.

Parameters

Component self - A reference to the component that is invoking this function.

Object saveContext - An object that can be used to reject the edit by calling saveContext.rejectSave('reason')

String rosterName - The name of the roster being edited.

Return

None

Parameters

Component self - A reference to the component that is invoking this function.

Object createContext - An object that can be used to reject the edit by calling createContext.rejectCreate('reason')

String rosterName - The name of the roster being created.

Return

None

onDeleteRoster

Description

Called when the delete button is pressed. This code is executed in a background thread.

• Parameters

Component self - A reference to the component that is invoking this function.

Object deleteContext - An object that can be used to reject the edit by calling deleteContext.rejectDelete('reason')

String rosterNames - A list of the roster names being deleted.

Return

None

Vision - SFC Monitor

Component Palette Icon:

👗 SFC Monitor

A component to monitor Sequential Function Chart performance. In addition the component allows for the operator to control the chart instance through the charts instance 'id' property. The chart scoped variables are available through the scope dataset property.

Properties

Name	Description	Property Type	Scripting	Categor
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Instance ID	The UUID of the sequential function chart to monitor.	String	.instanceld	Data
Instance List Visible	Shows or hides the list of SFC instances on the left.	boolean	instanceList Visible	Appearan
Legend Visible	Shows or hides the step and transition state legend.	boolean	legendVisible	Appearan
Name	The name of this component.	String	.name	Common
Scope Dataset	Dataset containing the variables in chart scope.	Dataset	scopeDatas et	Data
Scope Table Visible	Shows or hides the chart scope inspection table.	boolean	scopeTable Visible	Appearan
Visible	If disabled, the component will be hidden.	boolean	.visible	Common
Zoom	The zoom multiplier to display the chart's status at.	float	.zoom	Appearan

Component Palette Icon:

🚺 Alarm Status Table

The alarm status table displays the current state of the alarms available to the gateway (including those provided by Remote Tag Providers). It can be configured to show active, unacknowledged, cleared, and acknowledged alarms. By default it shows all non-cleared/non-ack'ed alarms. Acknowledge ment is handled by selecting (checking) alarms and pressing the "Acknowledge" button. If any of the selected alarms require acknowledge notes, then a small text area will be presented in which the operator must add notes to the acknowledgement.

Note: The Alarm Status Table component allows you to select an individual alarm, multiple alarms, or the Select All checkbox in the header bar. You can also use the Shift+Click multi select feature to select a range of alarms for acknowledging and shelving. Check one alarm and Shift+Click another alarm several rows down. All of the alarms between them, including the one you shift clicked, will be selected.

Interface Elements

Below is a listing of interface elements on the Alarm Status Table component. Note that these interactions are available from a Vision Client, as well as the Designer while Preview Mode is enabled.

Element	Description

Filtering

The Property Editor has a dedicated Filtering category of properties where you can configure determine which alarms appear on the component. By default, all alarms within the system appear on the table, but in many cases it can be desirable to only show a subset of alarms on the component at a time. Strings can be entered in these fields including wildcards to show specific subsets of alarms. These filtering properties can also be bound so the paths are dynamically created. Finally, you can enter multiple comma-delimited values to filter by.

Display Path Filtering

The **Display Path** can be customized on each alarm. The default value for an alarm's Display Path is a Tag path that leads to the name of the alarm. The image below, the top row has an alarm named **Alarm**, and is located on a Tag path of **Alarming Example/Integer Tag**, thus the Display path will resolve to '**Alarming Example/Integer Tag/Alarm**'. However, the Display Path can be customized when configuring the alarm. This is generally utilized to display readable messages as to what the issue is.

To filter entries on the table by the Display Path, simply set a value on the **Display Path Filter** property. The * wildcard can be used in the Display Path Filter. See the Source Path Filter Examples table below for more information.

Display Path	Source Path
Alarming Example/Integer Tag/Alarm	prov:default:/tag:Alarming Example/Integer Tag:/alm:Alarm
Alarming Example/Integer Tag/Alarm	prov:default:/tag:Alarming Example/Integer Tag:/alm:Alarm
Alarming Example/Integer Tag/Alarm	prov:default:/tag:Alarming Example/Integer Tag:/alm:Alarm

Source Path Filtering

The **Source Path** is also a path to the alarm, but also shows the Tag provider the alarm is located in. Again using the image above, if the name of the Tag provider is 'default', then the source path would resolve to 'prov:**default:**/Tag:**Alarming example/Integer Tag**:/alm:**Alarm**'. Unlike the Display Path, the Source Path on an alarm can never be overridden.

To filter entries on the table by Source Path, simply set a value on the **Source Filter** property. The * wildcard can be used in the Source Filter. See the Source Path Filter Examples table below for more information.

Source Path Filter Examples

The source path is made up of the alarm name, the tag path to the host tag, and the tag provider the tag resides in. This means the Source Filter property can be used to filter on tag folders and tag providers. For example, you may want the table to only show alarms that contain a certain term or folder path. The table below demonstrates some filters as well as some hypothetical results.

Example Filter	Result
prov:tagProvider:/tag:Inputs/PS_1: /alm:MyAlarm	Retrieve alarm information from the alarm at precisely the specified path: prov:tagProvider:/tag:Inputs/PS_1:/alm:MyAlarm
*PS_1:/alm:MyAlarm	Retrieves alarm information from any path that ends with $PS_1:/alm:MyAlarm$. Thus the following paths would be returned:
	prov:tagProvider:/tag:Inputs/PS_1:/alm:MyAlarm prov:tagProvider:/tag:anotherFolder/different_Path/PS_1:/alm:MyAlarm
prov:tagProvider:/tag:PS_*	Retrieves alarm information from any source path starting with "prov:tagProvider:/tag:PS_", such as:
	<pre>prov:tagProvider:/tag:PS_1:/alm:MyAlarm1 prov:tagProvider:/tag:PS_2/Tag2:/alm:MyAlarm2</pre>
MyAlarm	Retrieves any alarm information that has MyAlarm somewhere in the path.

State Filtering

The component can also filter entries based on the state of an alarm event. For example, the component can be configured to show only active alarms by enabling the Show Active and Unacked and Show Active and Acked properties.

Priority Filtering

The component can also filter alarm events based on a minimum priority level, allow the component to ignore lower priority alarm events. This is handled by the **Min Priority** property.

Alarm Property Filtering

Entries in the table can be filtered base on values of alarm properties by using the filterAlarm extension function. This includes Alarm Associated Data properties. See How to Filter by Associated Data on the Vision Alarm Status Table.

Properties

Name	Description	Property Type	Scripting	Categor
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Chart Resoluti on	The resolution for the ad-hoc tag historian chart.	int	chartResolut ion	Behavior
Date Format	A date format pattern used to format dates in the table. If blank, the default format for the locale is used.	String	.dateFormat	Appearan
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecate
Display Path Filter	Filter alarms by alarm display path, falling back to the source path if a custom display path isn't set. Specify multiple paths by separating them with commas. Supports the wildcard "*", which represents any number of characters.	String	displayPath Filter	Filters
	In the example below, only alarms that contained "High Temperature Alarm" would appear in the table.			
	High Temperature Alarm			
Duration	Formate atulas for fields like Active and Ack durational Lang. Short, Compact, and Abbraviated, Duration Format	int		Appeoran
Format	property, allows users to format the time units on the Active Duration column.	Int	durationFor mat	Appearan
Enabled	If disabled, a component cannot be used.	boolean	componentE nabled	Common
Flash Interval	The time interval to use for flashing row styles.	int	flashInterval	Appearan
Journal Name	The name of the alarm journal to query for the chart's annotations. Leave this blank to automatically pick the journal if there is only one.	String	alarmJourna IName	Behavior
Marquee Mode	Turn the table into a scrolling marquee	boolean	marqueeMo de	Behavior
Min Priority	The minimum priority alarm to be displayed by this table.	int	.minPriority	Filters
Multi Select	Allow multi select. Will show/hide the checkbox column.	boolean	.multiSelect	Behavior
Name	The name of this component.	String	.name	Common
Notes Area Border	The border surrounding the notes area.	Border	notesAreaB order	Appearan
Notes Area Font	The font for the notes area.	Font	notesAreaF ont	Appearan
Notes Area Location	The location of the notes display area.	int	notesAreaL ocation	Appearan

Notes Area Size	The size of the notes area, in pixels.	int	notesAreaSi ze	Appearan
Number Format	A number format string to control the format of the value column.	String	numberFor mat	Appearan
Provider Filter	Filter alarms by Tag provider. Specify multiple providers by separating them with commas. A value of "." denotes the default Tag provider.	String	providerFilter	Filters
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data
Refresh Rate	The rate at which this table will poll changes to the alarm status, in milliseconds.	long	.refreshRate	Behavior
Row Height	The height, in pixels, for each row of the table.	int	.rowHeight	Appearan
Row Styles	A dataset containing the different styles configured for different alarm states.	Dataset	.rowStyles	Appearan
Scroll Delay	The time in milliseconds to wait between performing each step in a scroll	int	.scrollDelay	Behavior
Selected Alarms	A dataset containing each selected alarm. (Read-only)	Dataset	selectedAlar ms	Data
Selectio n Color	The color of the selection border. Can be chosen from color wheel, chosen from color palette, or entered as RGB o r HSL value. See Color Selector.	Color	selectionCol or	Appearan
Selectio n Thickness	The size of the selection border.	int	selectionThi ckness	Appearan
Shelving Times	This dataset holds the times that are suggested when shelving an alarm. New entries added to this dataset will be selectable by users when they attempt to shelve an alarm on the component. Allowable units are second, minute, hour, or day.	Dataset	shelvingTim es	Data
Show Ack Button	Show the acknowledge button on the footer panel.	boolean	.showAck	Appearan
Show Active and Acked	Show alarms that are active and acknowledged.	boolean	activeAndAc ked	Filters
Show Active and Unacked	Show alarms that are active and unacknowledged.	boolean	activeAndU nacked	Filters
Show Chart Button	Show the chart button on the footer panel.	boolean	.showChart	Appearan
Show Clear and Acked	Show alarms that are cleared and acknowledged.	boolean	clearAndAck ed	Filters
Show Clear and Unacked	Show alarms that are cleared and unacknowledged.	boolean	clearAndUn acked	Filters
Show Details Button	Show the view details button on the footer panel.	boolean	showDetails	Appearan
Show Footer	Show a footer with acknowledge and shelf functions below the alarms.	boolean	showFooter Panel	Appearan
Show Header Popup	Toggles the table header's built-in column selection popup menu.	boolean	showTableH eaderPopup	Appearan
Show Manage Shelf Button	Show the manage shelf button on the footer panel.	boolean	showManag eShelf	Appearan
Show Shelve Button	Show the shelve button on the footer panel.	boolean	showShelve	Appearan

Show Table Header	Toggles visibility of the table's header.	boolean	showTableH eader	Appearan
Sort Oldest First	Sort times by oldest first.	boolean	sortOldestFi rst	Behavior
Sort Order	The default sort order for alarms in the status table.	int	.sortOrder	Behavior
Source Filter	Filter alarms by alarm source path, causing the table to only show alarms that match the filter. Specify multiple paths by separating them with commas. Supports the wildcard "*". See Source Path Filter Examples.	String	.sourceFilter	Filters
Stay Delay	The time (in mSec) to wait between scrolls	int	.stayDelay	Behavior
Table Backgro und	The background of the alarm table. See Color Selector.	Color	tableBackgr ound	Appearan
Table		Font	.font	Appearan
Font	The following feature is new in Ignition version 8.1.14 Click here to check out the other new features			
	The font for the table rows.			
Table		int		Appearan
Header Alignme nt	The following feature is new in Ignition version 8.1.14 Click here to check out the other new features		headerAlign ment	
	The alignment for each column in the table header.			
Table Header Font	The font for the table header.	Font	tableHeader Font	Appearan
Touchsc reen Mode	Controls when this input component responds if touchscreen mode is enabled.	int	touchscreen Mode	Behavior
Visible	If disabled, the component will be hidden.	boolean	.visible	Common

Alarm Row Styles - Alarm Journal Table

Description

The Alarm Row Styles Customizer manages the way the Alarm Status Table and the Alarm Journal Table render each alarm. The Alarm Row Styles Customizer allows you to change the styles of the alarms and the logic that governs each style. Both the Alarm Status Table and the Alarm Journal Table evaluate each alarm and applies the logic of the expression block to decide to implement a style. If the expression returns a logical "True" then the Alarm Row Styles Customizer applies the color formatting options defined in the area to the right of the Expression block. If the expression returns a logical "False" then the Alarm Row Styles Customizer evaluates the next expression associated with the next row style. The process continues until an expression returns a logical "True." There can be many rows with different logic and styles. You can add and remove rows by selecting the "plus" button or "delete" button.

Customizers

The Alarm Row Styles Customizer is used by both the Alarm Status Table and the Alarm Journal Table components. Each table comes with their own predefined set of colors. The Alarm Row Styles Customizer is where you can modify an existing style, add more styles, delete a style, and change the order. Each row style has an expression, a color, and the option to make it blink. The Alarm Row Styles Customizer already has some preset states and predefined styles to help you get started. It works by changing colors on each of the individual rows styles based on the state of the alarm.

Alarm Rows Styles Customizer - Property Descriptions

Property	Description
Row Styles	Each row has a unique style associated with each of the alarm states. You can add and delete row styles, and change the order of the rows with the up or down arrow buttons.
Expression	Each style has an expression. The expression allows you to do any evaluation you want using any parts of the alarm: Priority, State, Display Path, Active Time, and Clear Time.
Standard	One solid color on a row style.
Blink	Two colors alternately flashing on a row style used to draw attention. Commonly used for critical alarms to draw the operator's attention.
Foreground	Specifies the color of the text.
Background	Specifies the color of the row.
Font	Specifies the font type, font size, and style.

Examples

In these examples, the Alarm Row Styles was modified for the Alarm Status Table and the Alarm Journal Table to add another row style for Active, Unacknowledged alarms with a priority 4, or Critical alarms.

How to Filter by Associated Data on the Vision Alarm Status Table

Filtering on Associated Data

Another way to filter alarms in the **Alarm Status Table** is using associated data that was added to an alarm. You can easily and quickly search, filter, and display on specific alarms based on associated data configured in an alarm.

Using a Script to Filter on Associated Data

It's a common design practice to associate alarm groupings on associated data of an alarm. Scripting gives you the ability to filter on associated data, but also gives you the freedom to filter on anything that you want. In the following example, we used a script to filter on associated data, but first we need to add associated data and set up an alarm group.

Here we have a Memory Tag called 'Speed' with a configured alarm called 'High Speed.' To add

associated data, click the **Add** ⁺ icon at the top of the Tag Editor, scroll down the list of alarm properties to Associated Data, rename '**New Data'** to '**Group'** and add a static value called '**Production**.' Click **Commit** and save your Tag.

Alarm Status -Filter on Associated Data

On this page ...

• Filtering on Associated Data

Using a Script to Filter on

Watch the Video

Next, create a script to filter for all alarms in the Alarm Status Table that have the associated data called '**Production.**' Scripting allows you to use the '**filterAlarm**' extension function specifically for filtering on associated data.

- 1. Right click on your Alarm Status Table component, and scroll down and select Scripting.
- 2. In the Component Scripting window, under Extension Functions, select 'filterAlarm.'
- 3. Click the Enabled checkbox.
- 4. Enter the code below into the 'filterAlarm' script. You can filter on anything you want here, but in this example, we are going to filter on 'Prod uction.'

Extension Function - filterAlarm for 'Production' group = alarmEvent.get("Group") if group == "Production": return True return False

Your script will look like the image below. This script will only display alarms matching the associated data for **'Production.'** For every alarm matching **'Production,'** it will return **'True'** and show alarm results in the Alarm Status Table. If the associated data does not match **'Production,'** it will return **'False,'** and the Alarm Status Table will be empty. Note, when you're finished filtering on associated data, don't forget to disable your script.

🍘 Component Scripting [Alarm	Status Table] —		×
Event Handlers	< 🗹 Enabled		
 	<pre>def filterAlarm(self, alarmEvent): """ Galled for each event loaded into the alarm status table. Return false to hide this event from the table. This code is executed in a background thread. Arguments: self: A reference to the component that is invoking this function. alarmEvent: The alarm event itself. Call</pre>	name',	
	ОК Арріу	Can	cel

- 5. Click OK.
- 6. Now the Alarm Status Table below shows all the alarms in the **'Production'** group. Select an alarm and click the **Search** icon to see all the **Details** about the alarm.

- Ac	tive Time	Display Path	Label	Event Value	Priority	Current State
6/13/1	9, 7:19 AM	Speed/High Speed	High Speed	130	Critical	Active, Unack
6/13/1	9, 7:19 AM	Humidity/High Humidity	High Humidity	86	Critical	Active, Unack
Details	Notes					×

Acknowl	edge S	Shelve				₽ 🛛 🛢

Note:

- If you see alarms that do not match your associated data, check your filter settings in the Property Editor of the Alarm Status Table. You may need to uncheck the 'Show Clear and Unacked' and 'Show Clear and Acked' settings depending on what you want your operators to see.
- If you have an error in this filtering script, it will return 'true' for every alarm instance (and show all alarms) instead of displaying many errors to your users. You can find more information about the error from the Output Console under the Tools Menu in the Designer, and from the Vision Client under Help > Diagnostics and selecting the Console tab.

How To Restrict Acknowledgement on the Vision Alarm Status Table Component

Security for Alarm Acknowledgement

If you want to restrict who can use the Acknowledge button, there is the **Show Ack Button** in the Property Editor that can be set to **'False.'** By setting the **Show Ack Button** to **'false,'** this hides the Acknowledge button on the Alarm Status Table.

In order for operators to acknowledge alarms, the correct permission must be assigned. This example shows how to set permissions to acknowledge alarms for users in the **Operator** role. You can setup permissions for any role, user and user source in your system.

- 1. Select the Alarm Status Table component, and click the Show Ack Button binding 🖙 icon to open the Property Binding window.
- 2. Under Property Binding Type, select Expression.
- 3. Click the Function ² icon and scroll down to Users, and select 'hasRole.' This enters the function name.
- 4. Edit the expression to read: hasRole("Operator")
- 5. Click OK.

If you currently have the "Operator" role you will notice that the Show Ack Button property is now 'true,' otherwise, it will be 'false.'

Vision - Alarm Status Table Scripting Functions

This page details the various component and extension functions available for Vision's Alarm Status Table component.

Component Functions

.print(fitWidth, headerFormat, footerFormat, showDialog, landscape)

Description

This specialized print function will paginate the table onto multiple pages. This function accepts keyword-style invocation.

Keyword Args

boolean fitWidth - If true, the table's width will be stretched to fit across one page's width. Rows will still paginate normally. If false, the table will paginate columns onto extra pages. (default = true) [optional]

string headerFormat - A string to use as the table's page header. The substring "{0}" will be replaced with the current page number. (default = None) [optional]

string footerFormat - A string to use as the table's page footer. The substring "{0}" will be replaced with the current page number. (default = "Page {0}") [optional]

boolean showDialog - Whether or not the print dialog should be shown to the user. Default is true. [optional]

boolean landscape - Used to specify portrait (0) or landscape (1) mode. Default is portrait (0). [optional]

Return

Boolean- True if the print job was successful.

.getAlarms()

Description

Returns a dataset of the alarms currently displayed in the Alarm Status Table component. The columns will be: EventId, Source, DisplayPath, EventTime, State, and Priority.

Keyword Args

None

Return

Dataset - A dataset of alarms.

Extension Functions

createPopupMenu

Description

Returns a popup menu that will be displayed when the user triggers a popup menu (right click) in the table. Use system.gui. PopupMenu to create the popup menu.

Parameters

Component self- A reference to the component that is invoking this function.

List selectedAlarmEvents - The alarm events selected on the Alarm Status Table. For an individual alarm Event, call *alarmEvent.get* (*'propertyName'*) to inspect. Common properties: 'name', 'source', 'priority'.

Return

Object - the popup menu.

On this page ...

- onDoubleClicked
- onAcknowledge
- onShelve

filterAlarm

Description

Called for each event loaded into the alarm status table. Return false to hide this event from the table. This code is executed in a background thread so it has a minimal impact on client performance.

Parameters

Component self- A reference to the component that is invoking this function.

PyAlarmEvent alarmEvent - The alarm event itself. Call alarmEvent.get('propertyName') to inspect. Common properties: 'name', 'source', 'priority'.

Return

Boolean- Returns true or false for every alarm event in the table. True will show the alarm. False will not show the alarm.

filterAlarm Example

The filterAlarm Extension Function can be used to filter results on the table based on Alarm Associated Data, allowing you to devise custom filtering criteria. For example, if you wanted the table to only show alarms that had an associated data property named "Production", you could add the following:

Filtering Example

```
group = alarmEvent.get("Group")
if group == "Production":
    return True
return False  # It is important to always include logic where False can be returned for alarm
events that don't match your criteria
```

If the script fails to compile, then the table will show alarms as if a filterAlarm script was not configured.

isAcknowledgeEnabled

Description

Returns a boolean that represents whether the selected alarm can be acknowledged

Parameters

Component self- A reference to the component that is invoking this function.

List selectedAlarmEvents - The alarm events selected on the Alarm Status Table. For an individual alarmEvent, call alarmEvent.get ('propertyName') to inspect. Common properties: 'name', 'source', 'priority'.

Return

Boolean- Returns true or false for every alarm event in the table.

isShelvedEnabled

Description

Returns a boolean that represents whether the selected alarm can be shelved.

Parameters

Component self- A reference to the component that is invoking this function.

List selectedAlarmEvents - The alarm events selected on the Alarm Status Table. For an individual alarmEvent, call alarmEvent.get (propertyName') to inspect. Common properties: 'name', 'source', 'priority'.

Return

Boolean- Returns true or false for every alarm event in the table.

onDoubleClicked

Description

Called when an alarm is double-clicked on to provide custom functionality.

• Parameters

Component self- A reference to the component that is invoking this function.

Alarm Event alarmEvent - The alarm event that was double clicked. For an individual alarmEvent, call alarmEvent.get('propertyName') to inspect. Common properties: 'name', 'source', 'priority'.

Return

None

onAcknowledge

Description

Called when the Acknowledge button is pressed; the script runs before the ack happens. Return False to abort the acknowledgement, return True to continue as normal.

Parameters

Component self- A reference to the component that is invoking this function.

List alarms - A list of the alarms to be acknowledged.

Return

Boolean- Returns true or false for every alarm event that is selected.

onShelve

The following feature is new in Ignition version **8.1.25** Click here to check out the other new features

Description

Called when the Apply button is pressed on the Shelving panel; the script runs before the shelving happens. Return False to abort shelving, return True to continue as normal.

Parameters

Component self - A reference to the component that is invoking this function.

List alarms - A list of the alarms to be shelved.

Return

Boolean - Returns true or false for every alarm event that is selected.

Component Palette Icon:

셼 Alarm Journal Table

The alarm journal table provides a built-in view to explore alarm history that has been stored in an alarm journal. If you only have one alarm journal specified on your Gateway, then you do not need to specify the journal name. If you have more than one specified, then you need to provide the name of the journal you'd like to query.

The journal table shows the alarm history that is found between the **Start Date** and **End Date** properti es. When you first put an alarm journal table on a window, these properties will be set to show the most recent few hours of journal history. Note that without further configuration, the journal table will always show the few hours before it was created. To properly configure an alarm journal table, bind its start and end date properties to something what will update, such as the Date Range component or expressions involving the now expression function. This way, you can configure it so that operators can choose the time to display, or have dates will be update automatically to have it poll.

See the Vision - Alarm Journal Table Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

The Alarm Row Styles Customizer manages the way the Alarm Journal renders each alarm.

• Vision Component Customizers

Vision Alarm Journal - Row Styles

The Alarm Journal Table allows you customize row styles for different states of alarm history. Just like the Alarm Status Table, the Alarm Journal Table comes with a particular set of colors associated with each of the alarm states as shown in the image below. You can change these colors for each of the states by going to the Alarms Styles Customizer that the Alarm Journal Table component provides.

1 1 1 1 Iun	6 lun11 li	n 16	lun 21	lun 26	
Event Time	Display Path	Name	Event Value	Event State	Priority
5/28/19, 10:53 AM	Motors/Motor 1/Amps/Low Amps	Low Amps	52	Clear	Critical
5/28/19, 10:53 AM	Ramp/Ramp8/OPC Alarm	OPC Alarm	302.7467	Active	High
5/28/19, 10:53 AM	Ramp/Ramp8/OPC Alarm	OPC Alarm		Ack	High
5/28/19, 10:53 AM	Motors/Motor 1/Amps/Low Amps	Low Amps	46	Active	Critical
5/28/19, 10:53 AM	Motors/Motor 1/Amps/Low Amps	Low Amps		Ack	Critical
5/28/19, 10:53 AM	Motors/Motor 1/Amps/Low Amps	Low Amps	52	Clear	Critical
5/28/19, 10:53 AM	Ramp/Ramp8/OPC Alarm	OPC Alarm	169.3867	Clear	High
5/28/19, 10:53 AM	Motor Plant/Motor 2/Amps/Low A	Low Amps	20	Active	Critical
5/28/19. 10:53 AM	Motor Plant/Motor 2/Amps/Low A	Low Amps		Ack	Critical

Customizing Alarm Row Styles

Alarm Row Styles is where you can modify an existing row style, add more styles, or delete a style. The Alarm Row Styles Customizer gives you a head start for building a new expression. The expression allows you to do any evaluation you want using any filter properties of the alarm: Priority, State, Display Path, Active Time, and Clear Time.

In the Designer, right click on the Alarm Journal Table component, go to **Customizers > Alarm Row Styles** to see the default row styles. Alarm Row Styles is an ordered list and each style has an expression. How it works is, the first style that returns '**True**' for a given alarm is the one that is going to be used. So you want to make sure the order is the correct order that you want. If you want to change the order, select a row and click on the up or

icons. Click on each of the row styles to view the expression associated with the row style.

Row Styles			1
{isSystemEvent}			
{eventState}='Active'] `
{eventState}='Clear'			+
{eventState}='Ack'			8
<pre>xpression 1 {eventState}='Active'</pre>	Standard Foreground	Foreground	- 2
	Background	Background	- 4
<	> Font	Font	-

Creating Row Styles for Different Alarm States

down arrow 뙙

The main reason to create a new row style is for overlapping conditions for styling. Let's create another state alarm with a new row style and state.

- 1. With the Alarm Row Styles customizer open, click on the Add 👘 icon.
- 2. By default, the new alarm state is added to the bottom of the list. The following expression creates a new state for alarms 'Ack by the user admin.' Copy and paste the expression into the Expression area of the Row Styles window.

{ackUser}='usr-prov.default:/usr:admin'

- 3. To make this alarm state catch the attention of the operator, let's make the row style standout by making it blink. Make the foreground color 'B lack' and the background color 'Yellow.' Check the Blink box and make the foreground color 'Black' and background color 'Red.'
- 4. Move the new state for 'Ack by the user admin' above the 'Ack' state so it gets evaluated first, otherwise if 'Ack' state is evaluated first, it will become 'True' first and the new state 'Ack by the user admin' will never be evaluated.

5. Press OK to save your updates.

🖌 Alarm Row Styles				×	
Row Styles				1	
{isSystemEvent}				L.	
{eventState}='Active'					
{eventState}='Clear'					
{ackUser}='usr-prov.default:/usr:admin'				×	
{eventState}='Ack'					
Expression		Standard	🗹 Blink		
<pre>1 {ackUser}='usr-prov.default:/usr:admin'</pre>	^	Foreground	Foreground		
			- Q.	~ \ .	
		Background	Background		
			▼ \$,	▼ �.	
		Font	Font		
< >>	~		•	•	
			OK Canc	el	

6. Now, when the user 'admin' acknowledges an alarm, it will blink yellow and red in the Alarm Journal Table.

Vision - Alarm Journal Table Scripting Functions

This page details the various component and extension functions available for Vision's Alarm Journal Table component.

Component Functions

.print(fitWidth, headerFormat, footerFormat, showDialog, landscape)

Description

This specialized print function will paginate the table onto multiple pages. This function accepts keyword-style invocation.

Keyword Args

boolean fitWidth - If true, the table's width will be stretched to fit across one page's width. Rows will still paginate normally. If false, the table will paginate columns onto extra pages. (default = true) [optional]

String headerFormat - A string to use as the table's page header. The substring "{0}" will be replaced with the current page number. (default = None) [optional]

String footerFormat - A string to use as the table's page footer. The substring " $\{0\}$ " will be replaced with the current page number. (default = "Page $\{0\}$ ") [optional]

boolean showDialog - Whether or not the print dialog should be shown to the user. Default is true. [optional]

boolean landscape - Used to specify portrait (0) or landscape (1) mode. Default is portrait (0). [optional]

Return

boolean - True if the print job was successful.

.getAlarms()

Description

Returns a dataset of the alarms currently displayed in the Alarm Journal Table component. The columns will be: EventId, Source, DisplayPath, EventTime, State, Priority and IsSystemEvent

Keyword Args

None

Return

Dataset - A dataset of alarms.

Extension Functions

createPopupMenu

Description

Returns a popup menu that will be displayed when the user triggers a popup menu (right click) in the table. Use system.gui. createPopupMenu() to create the popup menu.

Parameters

Component self - A reference to the component that is invoking this function.

List selectedAlarmEvents - The alarm events selected on the Alarm Status Table. For an individual alarmEvent, call alarmEvent.get ('propertyName') to inspect. Common properties: 'name', 'source', 'priority'.

Return

JPopupMenu - A popup menu that was created with system.gui.createPopupMenu()

Component Palette Icon:

Container

A Container can contain other components, including other containers. Uses for containers include:

- Organization Containers can be used to group components together. These components can then be moved, copied, or deleted as a group. Furthermore, they will all be organized inside of their parent container in the project navigation tree, which makes them easier to find.
- Re-usability Containers provide the opportunity to create a complex component that is made up of multiple other components. For
 instance, if you wanted to make your own custom HOA control, you can put three buttons inside of a container and configure them to all use
 a 'status' property that you add to their parent Container. Now you have built an HOA control that can be re-used and treated like its own
 component. Create a date range control that generates a SQL WHERE clause that can be used to control Charts and Tables. Create a label
 /button control that can be used to display datapoints, and pop up a parameterized window that displays meta-data (engineering units,
 physical location, notes, etc.) about that datapoint. Creating re-usable controls with Containers containing multiple components is the key to
 rapid application development.
- Layout Containers are a great way to improve window aesthetics through borders and layout options.

(i) To move a container around on a window, you need to hold the alt key while clicking and dragging.

Name	Description	Property Type	Scripting	Categor
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			

Combine Repaints	Set this to true for containers with many sub-components that need to redraw frequently (flashing, rotating, animating).	boolean	combineRep aints	Behavior

Component Palette Icon:

Template Repeater

On this page ...

- PropertiesScripting
- Event Handlers
- Customizers
- Examples

The Template Repeater repeats instances of templates any number of times. It can arrange them vertically, horizontally, or in a "flow" layout, which can either be top-to-bottom or left-to-right. If there are too many to fit, a scrollbar will be shown. This makes it easy to quickly create screens that represent many similar pieces of equipment. It also can be used to create screens that are dynamic, and automatically configure themselves based on configuration stored in a database or tag structure. When first dropped on a window, the template repeater will look like any other empty container. To select the template to repeat, configure the repeater's Template Path property. There are two ways to set how many times the template should repeat:

- Count The template will be repeated X times, where X is the value of "Repeat Count". The repeat count starts at zero and increments X amount of times. Each value for X will be inserted into the custom property of the template that will be repeated. Template repeater inserts the value of X into the custom property on the template with the same name as the template repeater's "Index Parameter Name." For example, if the template has a custom property of "index" and the template repeater's Index Parameter Name is also "index," then the template will be repeated X many time with the value of X being inserted into the template's custom property called "index."
- Dataset The template will be repeated once for each row in the "Template Parameters" dataset. The template's custom properties with the same names as the dataset's column names will assume the values of each row of the dataset.

Note: An Example of configuring the Template Repeater can be found on the Using the Template Repeater page.

Name	Description	Property Type	Scripting	Category
Backgrou nd Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearance
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Flow Alignment	Alignment for "Flow" layout style. Options are: • Left / Top • Right / Bottom • Center	int	flowAlignment	Appearance
Flow Direction	When the layout style is flow, this property controls if the components in the container flow horizontally or vertically.	int	.flowDirection	Appearance
Horizonta I Gap	The gap size to use for horizontal gaps.	int	horizontalGap	Appearance
Index Paramete r Name	A name of an integer parameter on the template that will be set to an index number.	String	indexParam Name	Behavior

Layout Style	Controls how	the repeated template instances are laid out inside the repeater. Options are listed below:	int	.layoutStyle	Appearance
	Option	Description			
	Vertical	Template instances are listed vertically, top to bottom. The height of each instance will match the height of the template instance's definition. Each instance will resize horizontally to match the width of the Template Repeater. If there isn't enough space to render all instances in the Template Repeater, a scroll bar will appear on the repeater.			
	Horizontal	Templates are listed horizontally, left to right. The width of each instance will match the width of the template instance's definition. Each instance will resize vertically to match the height of the Template Repeater. If there isn't enough space to render all instances in the Template Repeater, a scroll bar will appear on the repeater.			
	Flow	Templates are placed using the rules specified on the Flow Direction and Flow Alignment properties. The width and height of each instance will match the dimensions on the template instance's definition. If there isn't enough space to render all instances in the Template Repeater, a scroll bar will appear on the repeater.			
	BestFit	Template positioned are determined automatically by the component. All instances will be resized so they are viewable on screen. In cases where a large number of instances are configured within the repeater, this mode can negatively impact readability by resizing the instances to the point where text on each instance becomes difficult to read.			
Marquee Mode	Turn the repe	eater into a scrolling marquee.	boolean	marqueeMode	Behavior
Name	The name of	this component.	String	.name	Common
Quality	The data qua	lity code for any Tag bindings on this component.	QualityCode	.quality	Data
Repeat Behavior	"Count" will r	epeat the template a number of times, assigning each template an index number. repeat the template once per row in the template parameter's dataset.	int	repeatBehavi or	Behavior
Repeat Count	The template	will be repeated this many times, if the repeat behavior is set to "Count."	int	.repeatCount	Behavior
Scroll Delay	The time (in r	milliseconds) to wait between performing each step in a scroll.	int	.scrollDelay	Behavior
Stay Delay	The time (in r	milliseconds) to wait between scrolls.	int	.stayDelay	Behavior
Template Paramete rs	This dataset set to "Datas	will be used to control the number of templates and the parameters set on the templates if the repeat behavior is et."	Dataset	templatePara ms	Behavior
Template Path	The path to the	he template that this container will repeat.	String	templatePath	Behavior
Vertical Gap	The gap size	to use for vertical gaps.	int	.verticalGap	Appearance
Visible	If disabled, th	e component will be hidden.	boolean	.visible	Common
Deprecate	d Properties				
Data Quality	The data qua	lity code for any Tag bindings on this component.	int	.dataQuality	Deprecated

Vision - Template Canvas

Component Palette Icon:

E Template Canvas

On this page ... • Properties • Scripting • Event Handlers • Customizers • Template Canvas Customizer -Property Description • Data Types and the Parameters Field • Examples

The template canvas is similar to the template repeater but allows for more control of the templates than the template repeater.

The Templates property on the template canvas is a dataset. Each row in this dataset represents a manifestation of a template. It can be the same template or a different template on each row. This dataset allows for control over the size, position and layout of the template. There are two methods of controlling the layout of each template inside the template canvas:

- Absolute Positioning The location of the template is explicitly managed through the "X" and "Y" columns of the Templates property's dataset. Consequently the columns labeled Width and Height control the size of the template.
- Layout Positioning The template canvas uses "MiG Layout" to manage the location of the template. Mig Layout is a common albeit complicated layout methodology. It supports layouts that wrap the templates automatically as well as docking the template to one side of the template canvas. You can learn more about MiG Layout at http://www.miglayout.com

In addition, control over data inside each template can be achieved by adding a column with the name Parameters to the dataset and populating this column with dictionary style key words and definitions.

Additional templates can be added to the template canvas by inserting an additional row to the Templates property's dataset. The same applies to removing the templates but with removing the rows from the dataset.

Name	Description	Property Type	Scripting	Categor
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearan

See the Vision - Template Canvas Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

This component has its own customizer called the Template Canvas Customizer. The Template Canvas Customizer allows you to create multiple instances of a template. Here is where you can configure some of the properties of the template instance that are inside the Template Canvas. To edit a template instance, select it from the Instances list. To cancel your edit and add a new instance instead, click the Cancel button in the bottom left.

Templates Property

The "Templates" property, in the Property Editor, stores all the data that is entered into the customizer. New template instances can be created directly on the "Templates" property as well. To edit or view the dataset, click the Dataset Viewer next to the "Templates" property.

Template Canvas Customizer - Property Description

Property	Description
Instances	A list of the templates currently in the Template Canvas.
Add/Edit Instances	Section of the Template Canvas Customizer where you add new instances and edit existing instances. Select an instance from above to edit that instance.
Name	Name of the selected template instance.
Z-Index	The index position along the Z axis that should be used for the instance. If left empty, then Z order will be determined by the row index position of the instance as it sits in the Template Canvas' Templates property.
Template	The template path for the selected template instance.
Absolute Positioning	Sets the position and size of the components inside the template. In order from left to right, the four boxes are X, Y, Width, and Height.
Layout Positioning	Uses MiGLayout to manage template location. It allows you to easily determine the layout of components or templates within a container (i.e., "span,wrap"). To learn more, go to http://www.miglayout.com
Parameters	Shows a list of all the parameters that are defined in the selected template. Specify the values for each template parameter. To make this dynamic, you must bind the Templates property of the Template Canvas.

More information on the Template Canvas Customizer can be found on the Component Customizers page.

Data Types and the Parameters Field

The "Parameters" field in the customizer accepts string values, but attempts to convert the value if the underlying template parameter is set to a nonstring type. In some cases this may require special formatting on the supplied string. The table below provides some examples.

Data Type	Expected Format	Format Examples
Color	Colors may be entered in as either a name, or an RBG string	red
		0,0,255

Date	Date objects may be entered as either a UNIX timestamp in milliseconds, or in the following notation. In all	1591374627000	
		2020-03-28 06: 38:00:000	
	yyyy-MM-dd HH:mm:ss.SSS yyyy-MM-dd MM/dd/yyyy MM/dd/yyyy HH:mm:ss hh:mm:ss a hh:mm a MM/dd/yyyy hh:mm:ss a yyyy-MM-dd HH:mm:ss.SSS yyyy-MM-dd HH:mm:ss EEE MMM dd HH:mm:ss z yyyy		

Examples

Code Snippet

#This example demonstrates how to pull value information from templates that are inside the template canvas. #This example assumes that each template has a custom property called ContentValue #Get all the template instances of the canvas. templates = event.source.parent.getComponent('Template Canvas').getAllTemplates() #The templates are a list therefore you can iterate through them. for template in templates:

#You can access the properties of the template. This example prints the ContentValue custom property to the console. print template.ContentValue

Code Snippet - Seach by Name

#This example demonstrates how to iterate through each template in a template canvas #looking for a named instance. Once found, print the value of a property on a component in #that instance. #This assumes that the canvas contains a template instance named "timerTemplate" and #a Timer component (named Timer) is inside the instance.

#Create a reference to the Template Canvas canvas = event.source.parent.getComponent('Template Canvas')

#Retrieve all template instances in the canvas tempInstance = canvas.getAllTemplates()

#Iterate through each template instance for template in tempInstance:

#Compare the name of each instance.
if template.getInstanceName() == "timerTemplate":

#Print the Value property on the Timer component inside the template
print template.getComponent("Timer").value

Code Snippet - Read User Input Example

#This script will retrieve a list of all templates in a template canvas, and record user input.

#The code is designed to work with the a User Input example, #but can be easily modified to work with different templates.

#Reference the template canvas component, and call the getAllTemplates() method. #This will return a list of every instance in the canvas templateList = event.source.parent.getComponent('Template Canvas').getAllTemplates()

#Initialize a list. User input from each text field will be stored in this variable
userInput = []

#Iterate through each template instance inside the canvas for template in templateList:

#add the user inputted value to the userInput list. The values are originally returned in Unicode. #the Python str() function is casting the Unicode values as string values. userInput.append(str(template.TextField_Text))

#Show the values in a messageBox. This could be replaced with an INSERT query, or some other action. #str() is used again to case the list as a string. This only required to work with the messageBox function #since the function requires a string argument be passed in system.gui.messageBox(str(userInput))

Vision - Template Canvas Scripting Functions

This page details the various component and extension functions available for Vision's Template Canvas component.

Component Functions

.getAllTemplates()

Description

Returns a list of the templates that comprise the template canvas.

Parameters

Nothing

Return

List - A list of VisionTemplate definitions. Each instance in the canvas will return its definition's name. The names of each instance can be accessed with getInstanceName(). Individual components in each instance can accessed with getComponent().

.getTemplate(name)

Description

Obtains the designated template object from the template canvas.

• Parameters

String name- The name of the template as defined by the "name" column of the dataset populating the template canvas.

Return

VisionTemplate - Returns the template instance. Properties on the instance can be access by calling .propertyName.

Extension Functions

initializeTemplate

Description

This will be called once per template that is loaded. This is a good chance to do any custom initialization or setting parameters on the template.

Parameters

Component self- A reference to the component that is invoking this function.

Vision Template template - The template. The name of the template in the dataset will be available as template.instanceName

Return

None

Vision - Paintable Canvas

On this page ... • Properties • Scripting • Component Functions • Extension Functions • Event Handlers

- Customizers
- Examples

Component Palette Icon:

🔪 Paintable Canvas

The Paintable Canvas component is a component that can be custom "painted" using Jython scripting. By responding to the component's repaint event , a designer can use Java2D to draw anything within the component's bounds. Whenever any dynamic properties on the component change, the component is re-painted automatically, making it possible to create dynamic, vector-drawn components that can represent anything.

This component is an advanced component for those who are very comfortable using scripting. It is not user-friendly. The upside is that it is extraordinarily powerful, as your imagination is the only limit with what this component can be.

When you first drop a Paintable Canvas onto a window, you'll notice that it looks like a placeholder. If you switch the Designer into preview mode, you'll see an icon of a pump displayed. The pump is an example that comes pre-loaded into the Paintable Canvas. By editing the component's event scripts, you can dissect how the pump was drawn. You will notice that the script uses Java2D. You can read more about Java2D here. You will notice that as you resize the pump, it scales beautifully in preview mode. Java2D is a vector drawing library, enabling you to create components that scale very gracefully.

Tips:

- Don't forget that you can add dynamic properties to this component, and use the styles feature. Use the values of dynamic properties in your repaint code to create a dynamic component. The component will repaint automatically when these values change.
- You can create an interactive component by responding to mouse and keyboard events
- You can store your custom components on a custom palette and use them like standard components.

Name	Description	Property Type	Scripting	Categor

Examples

Vision - Pipe Segment

Component Palette Icon:

Pipe Segment

On this page ... • Properties • Scripting • Component Functions • Extension Functions • Event Handlers • Customizers

The pipe segment component displays a quasi-3D pipe. In its basic form it looks very much like a rectangle with a round gradient. The difference comes in its advanced rendering of its edges and endcaps. You can configure each pipe segment's end to mate perfectly with another pipe segment butted up against it perpendicularly. The result looks like a pipe welded together in a 90° corner.

The control of the pipe's ends are done using 6 booleans - three per 'end'. End 1 is the top/left end, and End 2 is the bottom/right end. You turn off each boolean if there will be another pipe butted up against that side. The following diagram illustrates the naming conventions:

Name	Description	Property	Scrinting	Categor
Name		Туре	Scripting	Calegor
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common

- Customizers

The Sound Player component is an invisible component that facilitates audio playback in the client. Each Sound Player component has one sound clip associated with it, and will play that clip on demand. There is a built in triggering system, as well as facilities to loop the sound while the trigger is set. The sound clip needs to be a *.wav file. The clip becomes embedded within the window that the sound player is on. Clients do not need access to a shared *.wav file.

Properties

Name	Description	Property Type	Scripting	Category	
Loop Count	If Loop Mode is "Loop N Times", this is the "N".	int	.loopCount	Behavior	
Loop Mode	The Loop Mode determines how many times the sound is played when triggered.	int	.loopMode	Behavior	
Mouseover Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common	
Mute	If true, the clip will be muted during playback.	boolean	.mute	Behavior	
Name	The name of this component.	String	.name	Common	
Play Mode	The Play Mode determines whether the sound is played automatically on trigger or manually.	int	.playMode	Behavior	
Quality	The data quality code for any Tag bindings on this component.	QualityCode	.quality	Data	
Sound Data	The clip that this component will play.	byte[]	.soundData	Data	
Trigger	The clip will be played when the trigger is true, if Play Mode is "ON_TRIGGER"	boolean	.trigger	Data	
Volume	The volume to use for playback (from 0.0 to 1.0).	double	.volume	Behavior	
Deprecated Properties					
Data Quality	The data quality code for any Tag bindings on this component.	int	.dataQuality	Deprecated

Vision - Timer

On this page
 Properties Scripting Component Functions Extension Functions Event Handlers Customizers Examples

The timer button is an invisible button that can be used to create repeated events in a window. This is often used for animations or repetitive scripts within a window. When running, the timer's Value property is incremented by the Step By value, until the value tis the Bound, at which point it repeats. It is often useful to bind other values to a timer's Value property.

For instance, if you set the timer's Bound property to 360, and bind an object's rotation to the Value property, the object will spin in a circle when the timer is running.

How fast the timer counts is up to the Delay property, which is the time between counts in milliseconds.

Want to run a script every time the timer counts? First, make sure you don't actually want to write a project Timer Script, which will run on some interval whenever the application is running. In contrast, a script that works via a Timer component will only run while the window that contains the Timer is open, and the Timer is running. The way to do this is to attach an event script to the actionPerformed event.

Properties

Name	Description	Property Type	Scripting	Category
Bound	The value is always guaranteed to be less than this upper bound.	int	.max	Data
Delay (ms)	The delay in milliseconds between timer events.	int	.delay	Behavior
Initial Delay (ms)	The delay in milliseconds before the first event when running is set to true.	int	.initialDelay	Behavior
Name	The name of this component.	String	.name	Common
Running?	Determines whether or not the timer sends timer events.	boolean	.running	Behavior
Step by	The amount added to the value each time this timer fires for use as a counter. (should be positive)	int	.step	Data
Value	The current value of this timer, for use as a counter. At each iteration, this value will be set to ((value + step) MOD bound)	int	.value	Data

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

This component does not have any custom properties.

Examples

```
Expression Binding Example
//Suppose that you have images that make up frames of animation.
//Name your images: "Frame0.png", "Frame1.png", "Frame2.png". Set the timer's Bound to be 3, then bind the
image path of animate component to the following expression:
"Frame" + {Root Container.Timer.value} + ".png"
```

Vision - Signal Generator

Component Palette Icon:

Signal Generator

On this page ... Properties Scripting Component Functions Extension Functions Event Handlers Customizers

The signal generator is similar to the Timer component, but its value isn't simply a counter. Instead, you can choose from a variety of familiar signals. You configure the frequency by setting the Period property, which is in milliseconds. You configure the resolution by setting the ValuesPerPeriod property.

For example, if you choose a sine wave signal with a period of 2000 milliseconds and 10 valuesPerPeriod, your sine wave will have a frequency of 0.5 Hz, and its value will change 10 times every 2 seconds.

Properties

Name	Description	Property Type	Scripting	Category
Lower Bound	The lower bound of the signal value.	double	.lower	Data
Name	The name of this component.	String	.name	Common
Period	The period of the signal in milliseconds.	int	.period	Behavior
Running?	Determines whether or not the signal is being generated.	boolean	.running	Behavior
Signal Type	The signal type (shape) of the signal value.	int	.signalType	Behavior
Upper Bound	The upper bound of the signal value.	double	.upper	Data
Value	The current value of this signal generator.	double	.value	Data
Values/Period	The number of value changes per period.	int	.valuesPerPeriod	Behavior

Component Palette Icon:

Report Viewer

The Report Viewer component provides a way to run and view Reports in Vision windows. Parameters added during Report creation are provided as Properties in the Viewer and can override any default values set in the Report Resource. Right clicking on the Report Viewer brings up a menu that allows you to easily print the report or save it in various formats.

To begin using the Report Viewer, the project must first have at least one report configured. Once a report exists in the project, then the **Report Path** property on the Report Viewer can be used to select the report, which will cause the component to render the selected report. If the report has any parameters, those will be exposed under the **Report Parameters** category in the Property Editor, allowing you to configure bindings on them.

Interface Elements

Element	Description
Zoom Factor	Determines the zoom level of the rendered report.
Pager	Determines which page is currently shown in the report viewer.
Right Click	Right-clicking on the rendered report will present a popup menu, allowing the user to save a copy of the report, or print it out to an available printer.

Properties

Name	Description	Туре	Scripting	Category
Backgro und Color	Color that lays underneath the report. Can be chosen from color wheel, chosen from color palette, or entered as R GB or HSL value. See Color Selector.	Color	.background	Appearance
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Current Page	Current page in the report you would like to view.	Int	currentPage	Data

Fit Panel	Ignore the zoom and fit the report to the component.	Boolean	.fitPanel	Data
Foregro und Color	The foreground color the labels on the component. See Color Selector.	Color	.foreground	Appearance
Name	The name of this component.	String	.name	Common
Page Count	Number of pages in the report.	Int	.pageCount	Data
Report Loading	Returns true while the report is loading.	Boolean	reportLoading	N/A
	Note: This property does NOT appear in the Property Editor, but can easily be accessed from a Python script. Useful in scenarios where you wish to change the value of a parameter on the Report Viewer in a script and then do some additional work once the report has finished loading.			
Report Path	Path in the Project to the Report you would like to view.	String	.reportPath	Data
Show Controls	Show the bar with the page and the zoom controls.	Boolean	showControls	Appearance
Suggest ed Filename	The filename that will come up by default when the user saves the report to disk.	String	suggestedFi lename	Behavior
Visible	If disabled, the component will be hidden.	Boolean	.visible	Common
Zoom Factor	Zoom factor for the rendered report. This property directly controls the zoom factor interactive element displayed on the component.	Float	.zoomFactor	Data

Report Parameters Category

The Report Viewer component features a dynamic subset of properties under the **Report Parameters** category. This category is populated by report parameters that are defined on the reported specified by the **Report Path** property.

Scripting Functions

See the Vision - Report Viewer Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Examples

Utilizing reportLoading

```
reportViewer.print()
```

Vision - Report Viewer Scripting Functions

This page details the various component and extension functions available for Vision's Report Viewer component.

Component Functions

.print(printerName, showDialog)

Note: The following print method will only work if a report has finished loading on the Report Viewer component.

Description

Uses the named printer and determine if the print dialog window should appear or not.

• Parameters

String printerName - The name of the printer the report should be sent to. Will use the default printer if left blank. [optional]

Boolean showDialog - True if the dialog window should appear, False if the dialog window should be skipped. Will be true if left blank. [optional]

Return

None

print() Examples

print()

```
#calls print on a Report Viewer component located in the same window
```

```
reportViewer = event.source.parent.getComponent('Report Viewer')
reportViewer.print()
```

print() with default printer, no dialog

#calls print on a Report Viewer component located in the same window #bypasses the print dialog window and uses the default printer

reportViewer = event.source.parent.getComponent('Report Viewer')
reportViewer.print(None, False)

.getBytesPDF()

Description

Return the bytes of the generated report in the Report Viewer using PDF format.

Parameters

None

Return

Byte Array - The bytes of the report in PDF format.

.getBytesPNG()

On this page ...

- Component Functions
 .print(printerName, showDialog)
 - .getBytesPDF()
 - .getBytesPNG()
 - .saveAsPDF(fileName)
 - .saveAsXIs(fileName)
 - Extension Functions
 - onReportGenerated

Description

Return the bytes of the generated report in the Report Viewer using PNG format.

Parameters

None

Return

Byte Array - The bytes of the report in PNG format.

.saveAsPDF(fileName)

Description

Prompts the user to save a copy of the report as a PDF. Shows a file selection window with the extension set to PDF.

• Parameters

String fileName - A suggested filename to save the report as

Return

None

saveAsPDF() Example

Code Snippet - saveAsPDF()

```
#Saves the file as a PDF to a user selected location.
#The file selection window defaults to a name of "Daily Report"
```

```
reportViewer = event.source.parent.getComponent('Report Viewer')
reportViewer.saveAsPDF("Daily Report")
```

.saveAsXIs(fileName)

Description

Prompts the user to save a copy of the report as an XLS file. Shows a file selection window with the extension set to XLS.

Keyword Args

String fileName - A suggested filename to save the report as.

Return

None

Extension Functions

onReportGenerated

Description

Called when the Report generation process has been completed.

Keyword Args

Component self - A reference to the component invoking this method.

Byte Array pdfBytes - The PDF formatted bytes generated by the Report.

Return

None

Vision - Row Selector

Component Palette Icon:

On this page ...

- Properties
 - Scripting
 - Component Functions
 - Extension FunctionsEvent Handlers
- Customizers
- Examples

The row selector is a component that acts like a visual filter for datasets. It takes one dataset, chops it up into various ranges based on its configuration, and lets the user choose the splices. Then it creates a virtual dataset that only contains the rows that match the selected splices.

The most common way to splice the data is time. You could feed the row selector an input dataset that represents a large time range, and have it break it up by Month, Day, and then Shift, for example. Then you could power a report with the output dataset, and that would let the user dynamically create reports for any time range via an intuitive interface.

To configure the row selector, first set up the appropriate bindings for its input dataset. Then use its Customizer to alter the levels that it uses to break up the data. In the customizer, add various filters that act upon columns in the input dataset, sorting them by various criteria. For example, you could choose a date column, and have it break that up by quarter. Then below that, you could have it use a discrete filter on a product code. This would let the user choose quarterly results for each product. Each level of filter you create in the customizer becomes a level in the selection hierarchy. Note that the output data is completely unchanged other than the fact that rows that don't match the current user selection aren't present.

This component is very handy for driving the Report Viewer, Table, and Classic Chart components, among others.

Properties

Name	Description	Property Type	Scripting	Categor
All Data Node Text	Text for the All Data node, if it is displayed.	String	allDataNode Text	Appearan
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	Cursor	.cursor	Common
Data In	The input of the row selection tree. The filter tree changes based on this Dataset.	Dataset	.dataln	Data
Data Out	The output of the row selection tree. Changes based on user selection in the filter tree.	Dataset	.dataOut	Data

Expand All Data Node	If true, the 'All Data' (root) node will be expanded and selected when the user opens this window.	boolean	expandAllD ataNode	Behavior
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component. See Color Selector.	Color	.foreground	Appearan
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.tooltiptext	Common
Name	The name of this component.	String	.name	Common
Opaque	If false, backgrounds are not drawn. If true, backgrounds are drawn.	boolean	.opaque	Common
Selectio n Backgro und	The background color of the selected node. See Color Selector.	Color	selectionBa ckground	Appearan
Show All Data Node	Should the All Data (root) node be shown or hidden?	boolean	showAllData Node	Behavior
Show Node Size	If true, the number of rows in each node will be shown.	boolean	showNodeSi ze	Behavior
Show Root Handles	Should root-level nodes have collapse handles?	boolean	showRootH andles	Behavior
Unknow n Node Icon	Icon for any Unknown nodes (nodes where the data didn't match the filter).	String	unknownIco nPath	Appearan
Unknow n Node Text	Text for any Unknown nodes (nodes where the data didn't match the filter).	String	unknownNo deText	Appearan
Visible	If disabled, the component will be hidden.	Boolean	.visible	Common

Scripting

Component Functions

This component does not have component functions associated with it.

Extension Functions

This component does not have extension functions associated with it.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

The Row Selector has its own Row Selector Tree Customizer and allows users to customize the row filtering. The customizer provides some default filters which you can use, or customize based on the dataset.

The Row Selector Tree Customizer allows you to build and configure a tree of the data in the input dataset which can then be used to filter it. There are three main parts to the customizer. The left panel contains a list of available filters, the center panel contains a list of filters that will be used, and the right panel will contain configurable properties for the filter currently selected in the center panel.

In the Available Filters section on the left, a list of all of the columns of the dataset are shown. These can be expanded to show the filters available for that column type. Some columns might not have any filters, while others can have many, it just depends on the data type of column. These filters can

then be dragged into the center panel, or highlighted and the Right Arrow icon pressed to push the filter into the center panel where it becomes an active filter.

The Filters panel in the center contains a list of filters that are being used with each filter being followed by the name of the column that it originated from, and is where you can decide on the order of the filters. The order is important because it is the order in which they will be used in the component. Using the image below as an example, The component will first show a list of years. You can select a particular year, and the output dataset will only contain rows from that year. Alternately, you can expand a year where you will then see a list of strings that are in rows with that year. Selecting one of the strings will display all rows with strings like the one that you selected, that are also in the same year.

The Configure Filter panel on the right contains configurable settings that differ based on the type of filter selected. All filters at least contain an Icon Path property, which allows you to set what icon will be used with with that filter in the filter tree. Each filter type also has a reverse sort option, allowing you to have the filters displayed in reverse order in the filter tree. The unique properties are:

- Column Name
- Icon Path
- Format String (if applicable)
- Reverse Sort

Examples

There are no examples associated with this component. Refer to the examples in the Common Reporting Tasks.

Using the Row Selector

The Row Selector component allows users to filter a dataset based on unique values of one or more columns. Each level in the sorting tree is based on these properties. The user will see a dynamically generated expandable tree that groups their data by any number of choices. As a user clicks down the tree, objects bound to the dataset will indicate the filtered data.

A common way to filter the data is by time. For example, you can feed the Row Selector an input dataset that represents a large time range, and have it break it up by Year, Month, and Day. Then you can power a report with the output dataset that lets the user dynamically create reports for any time range. When configuring the Row Selector for the first time, you'll notice some default Date filters in the Row Selector Tree Customizer to help you quickly configure and filter raw data by time. If you don't want to filter your data by time, then simply delete the default filters and create your own.

See the Appendix for more information on the Row Selector.

A Row Selector has two important properties: **Data In** and **Data Out**. The Row Selector component filters the data in the **Data In** property and pushes the filtered result to the **Data Out** property. Let's configure a Row Selector to filter on some raw data. (This example uses a Power Table component which gives you the option of using some sample test data, or you can create your own data).

- 1. Drag a Power Table component on to your window and change the Name of the Power Table to "Data In Table".
- 2. Scroll down the Property Editor and set the **TestData** property to **'true'**. This will populate the **Data** property with some test data.
- Alternatively, you could manually populate the Data property using either the Dataset Viewer or by creating a binding on the property.
 Drag a Row Selector component on to your window. With the Row Selector selected, click the **Binding** icon on the Row Selector's **Data** In property.
- 4. Select the Property Binding Type, and bind it to the Data property in the Data In Table, and click OK.

- 5. Drag another Power Table component on to your window, change the Name to "Data Out Table".
- 6. With the Data Table Out still selected, bind the Data property to the Row Selector's Data Out property, and click OK.

Note:

7. Now let's configure your filters. Right click the Row Selector component and scroll down to Customizers > Row Selector Tree Customizer.

✓ 2 All D ► 2 U	ata nknow	n		_

The Row Selector Tree Customizer provides three default Date filters. Here you can customize the parameters of each Date filter or choose another filter type that is more appropriate for your dataset. Each column on the Data In Table will be listed in the Available Filters tree, and the types of filters available to each column depends on the datatype of the column.

- 8. To start customizing, select the first filter, then change the Column Name to Data Column. (This example uses the Date column to filter on the Month, Day, and Time combination.)
- 9. Change the Format String to MMMM yyyy.

10.	CIICK OK. Row Selector Tree Customizer					×

Note: When designing your report window, it's not necessary to display the Data In Table only the Data Out Table. You also don't need a component to house the data: the Data In property on the Row Selector could simply retrieve the raw data with a binding.

Here are a few more Row Selector examples:

- A Line Graph bound to a Row Selector Set up grouping to be first by month and year, then day, then hour, like the example above. Clicking
 on a month and year will dynamically update the graph for that time period. Further clicking to a specific day or hour will re-filter the graph for
 that period.
- A Report Viewer bound to a Row Selector Grouping by department (String) would allow selection by department, automatically regenerating the Report on selection.
- An "Alarm History" Table bound to a Row Selector This could first be broken down severity level (Integer), then broken into "Alarm Acknowledged" / "Not Acknowledged" (Boolean based). Clicking "Severity 3" would filter the table to all Severity 3 alarms. Selecting "Unacknowledged" would then filter the table to Unacknowledged alarms of Severity 3.

Component Palette Icon:

The column selector component is conceptually similar to the Row Selector, except that instead of filtering rows, it filters columns from its output dataset. Each column from the input dataset is shown as a checkbox. As the user checks and un-checks columns, the output dataset has those columns added or removed. This is very handy for driving the Table and Classic Chart components. In addition, this component can bring in multiple datasets and output just as many filtered datasets.

Properties

Name	Description	Property Type	Scripting	Categor
Alphabet ize	If true, checkboxes will be ordered alphabetically by their text.	Boolean	.alphabetize	Behavior
Backgro und Color	The background color of the component. Can be chosen from color wheel, chosen from color palette, or entered as RGB or HSL value. See Color Selector.	Color	.background	Appearan
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.			
Cursor	The mouse cursor to use when hovering over this component. Options are: Default, Crosshair, Text, Wait, Hand, Move, SW Resize, or SE Resize.	Int	.cursorCode	Common
Data In	Input dataset. This is the default when first dropping the component on the window, the name may change based on configuration and there may be more of these input dataset properties.	Dataset	.Data_in	Custom Properties
Data Out	Output dataset. This is the default when first dropping the component on the window, the name may change based on configuration and there may be more of these output dataset properties.	Dataset	.Data_out	Custom Properties
Font	Font of text on this component.	Font	.font	Appearan
Foregro und Color	The foreground color of the component. See Color Selector.	Color	.foreground	Appearan
Group By Data set	If true, checkboxes will be grouped by their dataset. Otherwise, checkboxes will be arranged flat.	Boolean	.grouping	Behavior

Horizont al Gap	The horizontal gap between checkboxes or grouping panels.	Int	.hGap	Appearan
Mouseo ver Text	The text that is displayed in the tooltip which pops up on mouseover of this component.	String	.toolTipText	Common
Name	The name of this component.	String	.name	Common
Normaliz e Widths	If true, all checkboxes will be assigned the same width, which causes them to line up in columns.	Boolean	normalizeWi dths	Appearan
Vertical Gap	The vertical gap between checkboxes and grouping panels.	Int	.vGap	Appearan
Visible	If disabled, the component will be hidden.	Boolean	.visible	Common

Extension Functions

This component does not have extension functions associated with it.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

The Column Selector component has its own Column Selector Panel Customizer that allows you to configure how the Column Selector filters columns.

The Column Selector Customizer contains two basic parts. The left side of the customizer allows you to configure how many datasets can be brought in for filtering. Each dataset added will add two additional custom properties to the Column Selector; an In dataset property and an Out filtered dataset property. Datasets can also be removed here, or moved up or down in the list. If there are multiple datasets, the columns from the first dataset in the list will be displayed at the top of the Column Selector, while the columns from the last will be at the bottom.

🖌 Column Selector Panel Customi	izer				×
DataSets Data2	>	Configuring Dataset Grouping Title Data Column Settings Name Int Column Float Column String Column Boolean Column Date Column	Display Int Column Float Column String Column Boolean Column Date Column	Excluded from Selection?	
	Jl	-	ОК	Cancel	

The right side of the customizer allows you to configure the settings for each dataset. When a dataset is highlighted on the left, we can see some basic information about it on the right, such as the Grouping Title and a list of all of the columns in that dataset. The Grouping Title is only used if there is more than one dataset in the Column Selector. In the component, each dataset's columns will be contained in a border and will display the Grouping Title. This can be configured to be anything, so that it is easier for a user to distinguish what each set of columns is for. In the Column Settings table, we see each one of the columns in that dataset listed out. Here, the Display column allows us to alter what name that column will display on the component, again allowing you to create names that are more meaningful to the user. Finally, the Excluded from Selection column allows you to exclude certain columns from being filtered. Columns that have this enabled will not show up in the list of columns on the component. This will not filter them out in the output dataset, but instead forces them to be in the output dataset.

Examples

Refer to the example on the Vision Reporting Components page.

Using the Column Selector

The Column Selector is similar to the Row Selector except that instead of filtering rows, it filters out entire columns from the output dataset. Each column from the input dataset is shown as a checkbox and allows users to show or hide variables in the datasets via the checkboxes, then output the resulting dataset.

The Column Selector allows users to choose which columns in a dataset they wish to use. If an object is bound to the Column Selector it will update itself whenever a user checks or unchecks a column. This allows users to dynamically show or hide Table columns, "pens" on a graph, data in a Report Viewer, or any other component set up to use a dataset.

Watch the Video

- 1. Drag a Power Table component on to your window and change the Name of the Power Table to "Data In Table".
- 2. Scroll down the Property Editor and set the TestData property to True. This will populate the Data property with some test data.
- 3. Drag a Column Selector component on to your window. With the Column Selector selected, click the **Binding** icon on the Column Selector's **Data In** property.
- 4. Select the Property Binding Type and bind it to the Data property in the Data In Table, and click OK.

- 5. Drag another Power Table component on to your window, change the Name to "Data Out Table".
- 6. Bind the Data of the Data Out Table property to the Column Selector Data Out property, and click OK.

7. Put your Designer into **Preview Mode**. In Preview Mode, you can can hide specific columns by unchecking the boxes in the Column Selector. 8. Use the check boxes to select columns you want displayed or hidden. In this example, we hid the **Boolean** and **Int** columns as shown in the

olumn Selector	Data In Table						
Boolean Column	Int Column	Float Colu	mn	String Colu	Boolean Col	Date Column	
Date Column	41	(0.27	6B354C0F		Jun 19, 2019	
Int Column	29	(0.21	63828E0B	~	Jun 19, 2019

	88	(0.53	27232AFB	~	Jun 20, 2019	
	92	(0.38	C4B03DFD		Jun 20, 2019	
	49	(0.78	6FBCF4CB		Jun 21, 2019	
	Data Out Table						
	Float Colu	ımn		String Column	Dat	e Column	
		0.27	6B35	54C0F	Jun 19, 20	19 1:12 AM	
		0.21	6382	28E0B	Jun 19, 201	19 4:12 AM	
		0.09	6107	'94D0	Jun 19, 201	19 1:12 PM	
		0.19	6F77	82A2	Jun 21, 20	19 4:12 PM	
		1	AF80	20E8	Jun 20, 20	19 1:12 AM	
		0.57	2D9	BAE5A	Jun 20, 20	19 4:12 AM	
		0.53	2723	32AFB	Jun 20, 20	19 1:12 PM	
		0.38	C4B	03DFD	lun 20, 20	19 4:12 PM	

9. If you want to customize the column display for all users, put the Designer back into Design mode.

10. Right click on the Column Selector and choose Customizers > Column Selector Customizer.

11. Click the Excluded from Selection box next to any column that you don't want displayed. The "Excluded from Selection" option determines if the user is allowed to hide the column from the client via the Column Selector.

DataSets		Configuring Da	taset: Data	
Data	+	Grouping Title	Data	
		Column Setting	;	
	•	Name	Display	Excluded from Selection?
		Int Column	Int Column	
		Float Column	Float Column	
		String Column	String Column	
		Boolean Colur	nn Boolean Column	
		Date Column	Date Column	

13. Now, the columns are excluded from the selection in the Customizer (Int and Boolean columns) and are not displayed in the Column Selector of the Client and prevented from being hidden by the user.

Component Palette Icon:

The File Explorer component displays a filesystem tree to the user. It can be rooted at any folder, even network folders. It can also filter the types of files that are displayed by their file extension (i.e., " pdf "). The path to the file that the user selects in the tree is exposed in the bindable property Selec ted Path.

The File Explorer component is typically used in conjunction with the PDF Viewer component in order to create a PDF viewing window. This is very useful for viewing manuals, documents, or reports from within your project. To use this component to drive a PDF Viewer component, refer to the PDF Viewer page.

The following feature is new in Ignition version 8.1.14 Click here to check out the other new features

Users can right-click on the File Explorer to refresh the component in a Vision Client.

File Explorer and PDF Viewer

Watch the Video

Let's set up the File Explorer and the PDF Viewer to create a window to view a PDF documents.

- 1. In Designer, drag a File Explorer component and PDF Viewer component on to a window and place them side by side.
- 2. Select the **PDF Viewer** component and click the binding icon **CP** next to the **File Path** property.
- 3. Select the Property binding type, and drill down to the File Explorer Selected Path property. Click OK.

4. Next, select the File Explorer component. In the Vision Property Editor, set the Selected Path property to a folder path. You can type in a path or bind the root directory by clicking on the binding icon is for the Selected Pathas shown in the image below. The Root Directory restricts which directories are accessible on the component. This is typically used to restrict access to a particular folder so that the user doesn't have access to the entire file system. All folders nested within the Root Directory can be accessed on the component.

Note: If you set the File Explorer's Root Directory to a <u>network</u> folder, all clients will be able to access documents within all folders in that <u>net work</u> folder.

5. To filter for only PDF file types, enter 'pdf' (without quotes) in the File Extension Filter property, otherwise, all file types will be displayed inside the Root Directory.

•	Behavior				1
	File extension filter	pdf		eð	
	Root Directory		ľ	eð	~

6. In Preview Mode, click on one of the reports in your Root Directory. The PDF Viewer works by passing the file path of the file you selected to the PDF Viewer. You'll also notice several PDF Viewer properties that drive the appearance of the PDF Viewer: Page Fit Mode, Hide or Show Toolbar, Utility Bar, Highlight, Select, Save, and Print.

Note: Clicking on the Save icon in the runtime saves a copy of the report to the client computer, not the Ignition Gateway.

Vision - PDF Viewer Scripting Functions

This page details the various component and extension functions available for Vision's PDF Viewer component.

Component Functions

.loadPDFBytes(bytes, name)

Description

This function will pass in the bytes of a PDF and load them into the PDF Viewer component. Please see Storing Files in a Database for more details

Parameters

string bytes - The bytes of the PDF to be displayed on the component

string name - The name of the PDF

Return

None

.print(showDialog)

- Since 7.8.2
- Description

This function will print the PDF.

• Parameters

boolean showDialog- If true, shows the user a print dialog. Default is true [optional]

Return

None

.setZoomFactor(zoom)

- Since 7.8.2
- Description

This function will set the current zoom level of the PDF, adjusted to stay within the minimum / maximum zoom range. Will zoom in on center of page.

Parameters

float zoom- Zoom factor to use. 1.0 is no zoom.

Return

None

Extension Functions

This component does not have extension functions associated with it.

On this page ...

- Component Functions
 - .loadPDFBytes(bytes, name)
 print(showDialog)
 - .print(showDialog).setZoomFactor(zoom)
- Extension Functions

Vision - Web Browser Palette

Web Browser Components

The following component gives you the ability to add a web browser to your client.

In This Section ...

Vision - Web Browser Component

Component Palette Icon:

The **Web Browser** component in the Designer allows you to embed a full web browser inside of an Ignition Client. This component becomes available in Designer after you download the Web Browser module from the Inductive Automation's website. The Web Browser module installs the same way as any other modules. Once this component is added onto a window, it will behave just like any other web browser when it is inside a Client.

Client machines need to meet the following minimum requirements to use this component. The component may not work properly if the requirements are not met.

Operating System Requirements

Note: This component utilizes JxBrowser. As a result it will only run on 64-bit operating systems that are supported by JxBrowser (ARM OS's are not supported at this time): https://jxbrowser-support.teamdev.com/docs/guides/introduction/requirements.html

Windows

- Microsoft Windows 7, 8, 8.1, 10, Server 2008 R2, Server 2012/2012 R2, Server 2016, Server 2019, 64-bit.
- Oracle (Sun) JRE 1.6.x and higher, 64-bit.

Linux

- Ubuntu 14.04+, Debian 8+, RedHat Enterprise Linux 7, openSUSE 13.3+, Fedora 24+, 64-bit
- Oracle (Sun) JRE 1.6.x and higher, 64-bit.

Required Linux Libraries Missing Libraries: Ubuntu 17.04

Ubuntu 17.04 is missing a library that is required for the component to run. Running the following command can resolve the issue:

```
sudo apt-get install libgconf-2-4
```

Mac OS X

- Mac OS X 10.10.x 11 (Intel)
- Apple or Oracle (Sun) JRE 1.6.x and higher, 64-bit.

Properties

Name	Description	Property Type	Scripting	Categor
Border	The border surrounding this component. Options are: No border, Etched (Lowered), Etched (Raised), Bevel (Lowered), Bevel (Raised), Bevel (Double), Field Border, and Line Border.	Border	.border	Common
	Note: The border is unaffected by rotation.			
	This feature was changed in Ignition version 8.1.21:			
	As of 8.1.21, the "Button Border" and "Other Border" options are removed.

Scripting

See the Vision - Web Browser Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Customizers

Vision Component Customizers

Examples

Setting Chromium Switches via JVM Arguments

The Web Browser component is based off of the JxBrowser library, which in turn is based upon the Chromium engine. As a result, the Web Browser component can be further customized by manipulating Chromium Switches.

Caution: Implementing these switches is considered **unsupported** because they can drastically change the behavior of the Web Browser component. The exception to this case is when a member of our support team requests a switch be added to help troubleshoot an issue. For the sake of clarity, instructions on how to manipulate the switches via the Designer Launcher and Vision Client Launcher are listed below, but we generally do not recommend users implement these switches.

If you're going to make use of a switch, then you would do so on the Designer Launcher's/Vision Client Launcher application, under the JVM Arguments field. Below is an example on how to configure a switch for a client using the Vision Client Launcher. The same method applies for the Designer Launcher.

- 1. Open the Vision Client Launcher.
- 2. Once open, either create a new application or manage the settings on an existing application.
- 3. Once the Settings are open, add a new entry into the JVM Arguments text area. Arguments for Chromium Switches must have a prefix of "-Dignition.chromium.switch." followed by the argument. Below is a example where we set the argument "mute-audio":

-Dignition.chromium.switch.mute-audio

nfigure New	Project		
General	Client Tag Overrides		
	Application Name		
	NewProject		
	Gateway Address		
	http://localhost:8088		
	Description		
	Vision Client Project		
	NewProject		
	Fallback Application		_
		•	
	Image Path		
	VisionIcon.ico		
	Window Mode	Screen Index	
	window	▼ 0	
	Timeout Retries Init Heap	Max Heap	
	30 -1 32M	256M	
	JVM Arguments		
	-Dignition chromium switch mute-audio		

4. Following this change, audio from the Web Browser Component will be muted once the client is launched.

Vision - Web Browser Scripting Functions

This page details the various component and extension functions available for Vision's Web Browser component.

Component Functions

.getBrowser()

Description

This function will return the underlying browser object. See JxBrowser Guidelines for more information.

• Parameters

None

Return

Object - The Browser Object.

.executeJavaScript()

Description

This function allows users to execute arbitrary JavaScript on the loaded page.

• Parameters

String javaScript - The code to execute on the page.

Return

None

.getImage()

Description

This function will return a byte array screenshot of the current browser window, in JPEG format.

Parameters

None

Return

ByteArray - The current browser window, rendered as a JPEG, in binary format.

.back()

Description

This function navigates one page back in the browser history.

Parameters

None

Return

None

.forward()

Description

This function navigates one page forward in the browser history.

Parameters

On this page ...

- Component Functions
 - .getBrowser()
 - .executeJavaScript()
 .executeJavaScript()
 - .getImage().back()
 - .back().forward()
 - .refresh()
- Extension Functions
- initialize()

None

Return

None

.refresh()

Description

This function refreshes the current page.

• Parameters

None

Return

None

Extension Functions

initialize()

The following feature is new in Ignition version **8.1.26** Click here to check out the other new features

Description

Called when the Web Browser component is initialized. Provides a chance to initialize the browser further. Enabling or disabling this function will cause the Web Browser component to re-initialize.

• Parameters

Component self: A reference to the component that is invoking this function.

JxBrowser browser: The underlying JxBrowser instance of the Browser class.

BrowserView browserView: The underlying rendering class that contains the Browser instance.

Return

Nothing

Window

Windows are the top-level unit of design for Vision projects. A window is identified by its path, which is the name of all its parent folders plus its name, with forward slashes (/) in between. For example, the path to a window in the top level called MainWindow would simply be its name, whereas the path to a window named **UserOptions** under a folder called **OptionsWindows** would be: **OptionsWindows/UserOptions**.

A window may display a Titlebar and/or a Border. The titlebar allows the user to drag the window around in the client, and houses the window's close and maximize/restore buttons. The border of a window can be used to resize the window in the client when it is floating or docked. Whether on not the titlebar and border are displayed depends on the values of the window's titlebar and border display policy properties, and its current state. Commonly, a window will display both a titlebar and border when it is configured as a popup. It is often desirable to remove titlebars and borders on main windows so they join seamlessly with docked windows.

The user manual describes different Window Types, but technically there is only a single window object in the Vision module: different "types" of windows are simply instances of the window object configured in different ways. See Window Types for more information about changing types.

Root Container

Inside a window is always the Root Container. The Root Container is where you will place all of your components in the window. This is exactly the same as a normal container component except that it cannot be deleted. When in the designer, "resizing" the window from the main Vision workspace is really changing the size of the Root Container.

Window Opening Event Order

Window objects have several event handlers that trigger when the window opens. However, each event handler occurs at a separate time. Because of this, it is important to understand the order that these events occur:

Opening a window - When opening a window for the first time in a designer, the following event handlers are called in order:

- 1. visionWindowOpened Important to notice the description on this event: it occurs before any bindings on the window are evaluated.
- 2. internalFrameOpened If the window has been cached, this will not fire on sequential opens.
- 3. internalFrameActivated The last event, but also repeatable while the window is opened, since this event will trigger again if the window loses and then regains focus without being closed in between.

Closing a window - When closing a window, the following event handlers are called in order:

- 1. internalFrameClosing This event would be ideal to "clean up" in the window, since the window is still technically open at this point.
- 2. visionWindowClosed Triggers when the window is closed. Functionally, this is similar to internalFrameClosed, but happens slightly earlier.
- internalFrameDeactivated This triggers when the window is closed, or when the window loses focus, so you may want to avoid this event if your script should only trigger when the window is closed.
- 4. internalFrameClosed Similar to visionWindowClosed. Triggers when the Java windowing system has finished closing the window.

Properties

Name	Description			Property Type	Scripting	Category

Scripting

See the Vision - The Window Object Scripting Functions page for the full list of scripting functions available for this component.

Event Handlers

Event handlers allow you to run a script based off specific triggers. See the full list of available event handlers on the Component Events page.

Examples

For examples of windows, please see the Vision Windows section.

Vision - The Window Object Scripting Functions

This page details the various component and extension functions available for Vision's Window Object components.

Component Functions

.getRootContainer

• Description

Returns a reference to the Root Container in the window.

Parameters

None

Return

Object - a reference to the Root Container, which is functionally just a Vision - Container.

.getComponentForPath

Description

Returns a reference to a component. The path parameter allows you to specify the full path to the component as a string.

Parameters

String path - The path to the component, using a period as a delimiter, such as "Root Container.Group.Label".

Return

Object - to the component specified, or None if there is a typo in the path.

Extension Functions

This component does not have extension functions associated with it.
